

Course guide English-Taught Courses

JUNIA.COM

HEI - ISEN - ISA

Junia (formerly Yncréa Hauts-de-France) is a French grande école graduate school of engineering delivering Masters of Science and Engineering degrees and offering a wide range of specializations. All of Junia's programmes are nationally and internationally accredited and fully recognised by the French government and the CTI, the French commission of engineering degrees.

VISIT JUNIA.COM TO LEARN MORE

Our graduate programs are taught in French, English or a combination of both languages. Students must have a minimum B2-level in the language of instruction. All programs are open to exchange students from our partner universities. Exchange students pursuing a Bachelor's degree in their home university may be eligible to take Master level courses according to their prerequisite courses. Access to a course is at the discretion of the academic coordinator and professor.

Junia has united the efforts of three engineering schools HEI, ISA and ISEN, working closely together to educate tomorrow's leaders in engineering innovation. Each programme maintains its own specialisations and unique offer. This guide gives all the details of English-taught courses available in each of our programmes: ISA, ISEN and HEI. Please visit each programme's dedicated webpage to learn more.

For more information on our academic offer, please contact international.cooperation@junia.com

MASTER

General Information

Master of Science and Engineering Program

Junia HEI trains well-rounded executive engineers with strong foundational skills in general engineering as well as expertise in one of 13 different specialisations, such as:

- Building and Civil Engineering,
- Mechanical,
- Computer Science and Information Technology,
- Biomedical Engineering,
- Industrial Operations Management and Logistics,
- Chemical Innovation and Ecological
- Transition Technologies,
- Innovation, and International Textile
 Management
- Mechatronics and Robotics,
- Energy, Electrical, and Control Systems.

JUNIA HEI curently offers 1 Master programme 100% taught in English: Smart Cities

The courses below are common to all Junia HEI Master programmes.

smart cities

Master of Science and Engineering Program

Cities are in constant transformation. New technological, social, and economic challenges present themselves constantly. Numerous trends are formed in the conception of modern cities, from optimist technological vision to ecological resilience.

Junia HEI's Master of Science and Engineering Smart Cities programme, 100% taught in English, offers students the aptitude and skills necessary to succeed as engineering leaders in this context.

principles and future trends in urbanism

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 1	25h	2,5	Vedrana Ikalovic, Ana Ruiz-Bowen	English	60% Continous Assessment25% Project15% Exam

This course is part of a module and must be taken in conjuction with Transport and Mobility Issues.

	COURSE OBJECTIVES	 Introduce main principles of part and contemporary urbanism Be able to identify efficient eco-neighborhood 			
	LEARNING OUTCOMES	 Explain the links between sustainable development and its application to a district Quote some eco-neighborhoods of reference (Freiburg-in-Brisgau, Eva Lanxmeer, Bedzed) Understand the Life Cycle Analysis principles, as far as a city is concerned 			
	CONTENT	The course begins asking two questions: "What is your favorite neighborhood?" and "What is your hated neighborhood?" Then, essential concepts are provided (e.g. sustainable development applied in a city or a district) and students prepare case studies presentations, with facts and figures and a SWOT Analysis. The course ends with a final project. For a chosen eco-neighborhood, you will play the role of a city advisor and you have to:			
\$= **=		Propose 12 indicators (4 on economic aspects, 4 on social/cultural aspects, 4 on environmental aspects). Propose definition, calculation method and unit. They have to be suitable to the econeighborhood context. The aim is to assess, over time, the performance of the neighborhood, as far as Sustainable development is concerned.			
		Propose a survey helping the city to improve the life quality, the resilience, and the relationships with the other parts of the town. This survey should be designed for inhabitants and could be filled by the users in 30 minutes.			

transport and mobility issues

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 1	30h	2,5	Philippe Tostain, Aurélie Montigny	English	40% Continous Assessment60% Project

This course is part of a module and must be taken in conjuction with Principles and Future Trends in Urbanism.

	COURSE OBJECTIVES	 Propose a general reflection about transport economy, policies and engineering Present principal concepts and analysis tools Propose approaches to illustrate the subject: Passengers rather than freight Urban and not rural Historical France and Europe, opening to the world Present different legislative and administrative frames of sustainable urban mobility planning (SUMP) in the EU and EU SUMP guidelines Present SUMPs support tool "JASPERS", operated by EIB Assess France's PDUs Present main streams of digital development in urban mobility Zoom on information systems and applications to enhance passenger mobility and intermodality Present potentials of an interchange hub for urban development Imagine such an interchange hub in Lille 		
	LEARNING OUTCOMES	 Present the historical trend of transport and some of its impacts, particularly on urban structure Quote basic figures of personal urban mobility Quote planning French urban mobility tools and stakeholders Analyze data and stakeholders of mobility issues and set up recommendations for proper functioning on a small scale area Identify outlines of several European SUMPs Quote indicators monitored by support tool "JASPERS" Quote French PDUs' strengths and weaknesses Quote and organize several passenger mobility apps Identify team organization main features Analyze urban context, data and stakeholders of mobility, set up recommendations for proper operation and new development of an interchange hub, design corresponding layout 		
√ 1111	CONTENT	 Issues 1: Transport in the economy: evolution and demand Issues 2: positive and negative impacts of transport Demand and supply: measurement, forecast, engineering, modelling and planning Transport policies: stakeholders, planning, financing Transport infrastructure From transport to mobility Study of accessibility of a company headquarters (e.g.: Castorama, located in the business park of Templemars, south-east of Lille, 9 km from Junia HEI campus) Lecture on sustainable urban mobility plans (SUMP): EU guidelines, national reality Lecture on digital technology and mobility, data and apps, incumbent operators and new players Interchange hub workshop: case study of "Porte des Postes": Definition of interchange hubs and reference developments Methodology, presentation of site and sources Project statement, team organization Tutorial course Presentation 		

architecture, construction and sustainable design

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 1	30h	2,5	Oliver Page, Ana Ruiz Bowen	English	50% Continous Assessment30% Project20% Exam

This course is part of a module and must be taken in conjuction with Fundamentals of Energy and Renewable Energies.

	COURSE OBJECTIVES	 Introduction to architecture and construction approaches Understand the project context (multidisciplinary, complexity) Present fundamental environmental issues in sustainable architecture
	LEARNING OUTCOMES	 Present full building analysis, taking into account architectural, technical and environmental issues Make thermal calculations Know the bioclimatic architecture through vernacular responses Understand the different technical and technological issues (thermal, ambiances, energy) but also architectural and urban issue at facet scale Design of the building envelope (climatic analysis, thermal environmental, carbon balance) Integrate multicriteria analysis into the design study Understand the importance of the morphology of a building: compactness and bioclimatic form
∮ :::	CONTENT	 Overview of several architectural projects, architectural approaches Environment site analysis Engineering approaches and structure Visit Architecture overview through history Construction stakeholders Building skins and envelope

fundamentals of energy and renewable energies

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 1	30h	2,5	Dhaker Abbes	English	50% Continous Assessment25% Practical Courses25% Exam

This course is part of a module and must be taken in conjuction with Architecture, Construction and Sustainable Design.

	COURSE OBJECTIVES	 Be aware about the context of energy transition and renewable energy systems from a social, ecologic and economic point of view. Make the difference between renewable and no renewable sources of energy Acquire the knowledge, necessary for modeling, simulation, control and design of standalone or a grid connected renewable energy systems.
	LEARNING OUTCOMES	 Assess renewable sources potentials. Evaluate the load of a building or a city. Choose the adequate source of energy according to the situation and to the load. Model, simulate, control and correctly connect an assembly of a wind turbine chain or a photovoltaic chain. Design of a standalone or a grid connected renewable energy system. Being able to tackle the issues related to renewable energy systems. Being able to make the difference between solar thermal energy and solar photovoltaic energy. Being able to make a technological survey and to innovate. To read and analyze the technical manual of a photovoltaic panel or a wind turbine. Use of simulation tools: Matlab/Simulink and HOMER energy.
\\	CONTENT	 Chapter 1 : Fundamentals of Energy (Dhaker) Chapter 2 : Renewable Energy Sources (Stéphane) Chapter 3 : Photovoltaic installation (Dhaker) Chapter 4 : Solar Thermal Energy Systems (Dhaker) Chapter 5 : Wind Energy Systems (Dhaker) TP1 : Modeling and simulation of a grid-connected photovoltaic system under Matlab/Simulink/Simpower TP2 : Dimensioning of a hybrid system Photovoltaic-Wind Turbine, Connected to the Network with the HOMER software Site visit (3h)

means of expression

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 1	20h	2	Ana Ruiz Bowen, Vedrana Ikalovic	English	■ 60% Continous Assessment ■ 40% Project

This course is part of a module and must be taken in conjuction with Innovation and Collaborative Projects.

	COURSE OBJECTIVES	To encourage the students to take a broader theoretical and practical approach to the notion of the 'city' through the direct experience and documentation of aspects of Lille.
		Have a greater contextual understanding of the way in which cities have been used by architects, artists and writers.
	LEADNING OUTCOMES	Research and document the city through drawing and 3D model making
	LEARNING OUTCOMES	 Develop and interrogate the potential of basic materials such as card, paper, balsa wood, markmaking materials
		Interpret and evaluate information and ideas from primary and secondary resources
	CONTENT	The workshops which takes place over three days will draw inspiration from the context of how other creatives have worked with the City as well as developing the students own individual responses the environment of the City.
\$= \$= \$*=		The workshop will include a presentation which provides the context for the project. There will be a series of practical tasks which involve a visual analysis of the city through moving around the city drawing and mark making. This visual resource will become the starting point for three dimensional work.
		Practical work with drawing, mark-making, 3D model making. Materials needed for the workshop are paper for drawing, pencils, black wax crayon, black ink, white and black paint. Masking tape, dressmaking pins (with a plain head), cardboard, Stanley knife (craft knife) and foam board.

innovation and collaborative project JWIA HEI

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 1	30h	3	Ana Ruiz Bowen	English	40% Continous Assessment30% Practical Courses30% Project

This course is part of a module and must be taken in conjuction with Means of Expression.

		Discover the challenges of managing innovation in organizations
		Practice creativity, divergence / convergence exercises in the context of Codesign sessions
		Use collective intelligence in an innovation / design process.
	COURSE OBJECTIVES	Have tools adapted to collaborative project management (Agile Method, Learning Networks)
		Know how to mobilize the collective intelligence in project management
		■ Discover co designs spaces and reflex in innovation ecosystems
		■ Introduction to urban scale and innovation topics in the city
		Analyze the bases of technical, social and architectural innovation
	LEARNING OUTCOMES	Know the strengths and limitations of «classic» project management processes.
		Know the organization and management of innovative organizations
		Put into practice the collaborative project management and practice feedback (capitalization).
		■ Get use to design thinking methods
		Through collaborative practice, students have an overview of the smart cities context.
		 Students will produce models and documents related to the urban environment.
c S		Students will practice several activities in order to experiment new ways of innovative
\$= \$= \$=	CONTENT	management.
		They will visit new creative companies and perform a benchmark of social, architectural and technical innovation.

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 1	48h	3	Ana Ruiz Bowen	English	40% Continous Assessment30% Project30% Exam

	COURSE OBJECTIVES	The subject of Workshop 1 is to reflect and design an urban program proposition, taking into account the urban scale, the environment issues and the social aspects.
	LEARNING OUTCOMES	 Design skills: Understand the importance of the site analysis: environmental, social, historic, economic aspects. Engage a research of references. Management skills: organizing a project team, using collaborative project tool Critical skills: understanding the project in the wider context of an engineering education and practice. Discover and deepen a thorough knowledge of ecological urban problems Begin to propose a sustainable urban space
\$;;;	CONTENT	 This studio is based on a real site. First, students will visit the site and meet the stakeholders. A functional roadmap will be provided (or compose with students). Secondly, a succession of workshops will allow exchange between professors and students. Students will provide technical and architectural documentations. They will engage deep reflection and research in their propositions. Finally, a panel will provide advises and critics on their projects.

urban project management

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 2	15h	1,5	François Laurent Touzain	English	70% Continous Assessment30% Project

This course is part of a module and must be taken in conjuction with Environmental Law and Ubiquity and the Internet of Things.

	COURSE OBJECTIVES	Provide a general overview and a toolkit about urban transformation management
	LEARNING OUTCOMES	 Analyze: a framework to understand any urban situation Model: tools to decide and manage (governance, technical issues, risks, economics, acceptance, informational system) Lead the transformation: systemic approach for efficiency
\$	CONTENT	 Case study 1: Use of the toolkit (analysis, model, lead), governance and value chain in city operations Case study 2: Planning and technical issues Case study 3: Consultation and communication Case study 4: Informational system for decision and action

environmental law

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 2	15h	1,5	Syrine Ismaili-Bastien	English	70% Continous Assessment30% Project

This course is part of a module and must be taken in conjuction with Urban Project Management and Ubiquity and the Internet of Things.

	COURSE OBJECTIVES	Give students a basic legal culture on environmental obligations protection
	LEARNING OUTCOMES	 Have an understanding of environmental concepts Be aware of the basics of urban planning law Know legal obligations and prohibitions on environmental protection Assess the feasibility of a project from a legal point of view
♦	CONTENT	 The course contains the definition of the legal language necessary for its comprehension. It sets out the rights and limits to be respected. The legislation studied is mainly French, European and international. Examples of other legislations are also given.

ubiquity and internet of things

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 2	20h	2	Jad Nassar	English	60% Continous Assessment40% Exam

This course is part of a module and must be taken in conjuction with Urban Project Management and Environmental Law.

	COURSE OBJECTIVES	Have a general knowledge about IoT technologies in a smart cities context				
A ()	LEARNING OUTCOMES	 Understand the concept of connected object and associated technologies Know the communication technologies related to ubiquity network Know how to use and associate these technologies 				
	Introduction	■ Introduction				
	From smart object to connected object	 Smart object or sensor The Arduino phenomenon Transition toward ARM architecture: the Rapsberry example Connected object = Smart object + Communication solution 				
CONTENT	Ubiquitous network: from PAN to WAN	 Wire networks (xDSL, Fibre, Ethernet) Wireless networks (3g/4g, femtocell, Wifi, Bluetooth) Machine 2 Machine (Zwave, Zigbee, LORA / SIGFOX) or sensor networks Vehicular application (V2V and V2I) Contactless technologies (RFID et NFC) 				
	Cloud computing	DatacenterCloud providers : Amazon, Microsoft, GoogleVirtualization : PAAS, SAAS, IAAS				
	Development and value-creation	Analysis (Big data) et VisualizationExample of big data for cities				
	Inhibitors of deployment Standardization, interoperability, data management, safety, organization					

dynamic thermal simulation and hvac

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 2	30h	2,5	Makram Abdellatif	English	40% Continous Assessment30% Project30% Exam

This course is part of a module and must be taken in conjuction with Building Management Systems and Home Automation.

	COURSE OBJECTIVES	 Introduction to architectural science and thermal performance of buildings Basic calculation for HVAC systems design Utilization of dynamic thermal simulation software
	LEARNING OUTCOMES	 Understand the French thermal regulation for new and existing buildings Calculate heating and cooling loads of a simple building Calculate the main parameters of a ventilation and air conditioning system Perform a full dynamic thermal simulation using relevant software
\\ !!!	CONTENT	 First, the course starts with an overview of the requirements included within the French thermal regulation for new and existing buildings. HVAC systems are introduced in relation to building envelope and thermal comfort. Simple methods to calculate heating loads, cooling loads and some HVAC systems parameters will be presented. Second, practical courses related to dynamic thermal simulation software are scheduled. Students will take part of a project that aims to perform a full dynamic thermal simulation for a small building or a part of a complex building.

building management systems and home automation

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 2	25h	2,5	Laurent Peyrodie	English	■ 60% Continous Assessment ■ 40% Project

This course is part of a module and must be taken in conjuction with Dynamic Thermal Simulation and HVAC.

	COURSE OBJECTIVES	 Introduce Building Management Systems (BMS) Understand the design and the implementation of Information and Communication Technologies (ICT) for the domestic, tertiary or medical buildings Know the basics of technical maintenance
	LEARNING OUTCOMES	 Understand the equipment positioning within complex projects Understand an energy management policy at building scale Be able to model and control technical equipment.
\$!!!	CONTENT	 Energy and environmental issues: public policies, financial tools, regulation context Energy management policies at building scale: energy efficiency approach, measurement and trouble-shooting, continuous improvement Energy costs: contract and pricing system, quality of energy. Energy consumption: lighting, building automation, electronic variation speed, communication, visualization Case study: Each case study underlines the energy and financial benefits actually reached, including payback time estimation. Practical work with Intouch software

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 2	30h	2,5	Simone Aragno	English	50% Continous Assessment50% Project

This course is part of a module and must be taken in conjuction with Introduction Lecture to Major Urban Challenges and Future Cities: Smart, Inclusive, and Sustainable.

	COURSE OBJECTIVES	 Introduction to parametric environmental design Introduction to the BIM concepts Presentation of the collaborative approaches available for the BIM
	LEARNING OUTCOMES	 Understand the benefits of a collaborative project in BIM Understand principles on parametric design Building 3D model and do simulation with Rhino grasshopper/Revit Dynamo Conduct result analysis and compare different design strategies Apply simulation skill on design optimization project
\$;;;	CONTENT	 Introduction about simulation tools and parametric environmental design. Exercise and tutorial about simple parametric geometry (Rhino grasshopper or Revit Dynamo). Lecture on simulation tools and data analysis (Ladybug tools &/OR GHCitySim) Simple case study and data analysis (urban design optimization) Assignment tutorial and final remarks Project presentation

introduction lecture to major urban challenges

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 2	10h	1	Ana Ruiz Bowen	English	85% Continous Assessment15% Practical courses

This course is part of a module and must be taken in conjuction with BIM and Future Cities: Smart, Inclusive, and Sustainable.

	COURSE OBJECTIVES	 Aware students to key urban challenges that cities and urban environment in general will have to face in the coming decades Develop scientific argumentation, scientific point of view and ethical approach in technology 		
	LEARNING OUTCOMES	 Develop critical eye on the "Smart Cities" concept Be able to discuss the main urban challenges that are coming next Organize a conference or an event on the Smart Cities topic 		
\$ =	CONTENT	Student will organize conferences with professionals, academics or citizens for the school audience on different topics such as circular economy, low tech/high tech design, gentrification, cities and climate change, etc.		

future cities: smart, inclusive and sustainable

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTE 1	R Semester 2	20h	2	Montserrat Pareja-Eastaway	English	65% Continous Assessment35% Project

This course is part of a module and must be taken in conjuction with BIM and Introduction Lecture to Major Urban Challenges.

	1	
		Improve methodological knowledge (qualitative, quantitative, case studies, etc.)
	COURSE OBJECTIVES	Identify current urban discourses and challenges in Europe
KU		Approach best practices in dealing with current urban problems
		Know in depth specific case studies.
	LEARNING OUTCOMES	■ Students will be able to review and understand the characteristics of the cultural / creative / smart economy and indicate why it is sensitive to local embedding. Local capacity building and the particularities of the cultural economy represent a productive strategy towards improving urban attractiveness and performance.
		Students will be able to critically analyze current policies and practices in the smart city
		 Students will be familiar with the three pillars of urban sustainability (environmental, social and economic)
\ \ \ \ \ \ \ \ \ \ \ \ \ \	CONTENT	The aim of this topic is to cover the broad range of theories and models related to the competitiveness of cities in a global world. From traditional theories to advanced reflections, these lectures are entitled to provide a framework of analysis of urban developments and strategies to improve cities' competitiveness. Cities are increasingly competing in a globalized world. The decline in manufacturing and economic restructuring means that urban performance progressively depends on certain sectors, which include knowledge and creative industries as their main source of added value. Attracting these sectors has become a key element of urban competitiveness and hence in the local political agenda. Urban regeneration processes linked to the creation of residential and business districts usually involve strategies oriented towards enhancing the economic performance of the city. Global world and urban contexts. The effects of globalization in local thinking. Challenges and projects around the global urban competitiveness. Economic structure and urbanization: from the post-fordist city to the post-modern city. Relationship between systems of economic reproduction with systems of social reproduction and the diversity of the urban form. Questioning the effect of loT in the local arena. Localization factors and urban context: Hard factors, soft factors, clusters and networks. From traditional location factors to the new requirements of the creative city. How does the local environment react to the new demands? Pathways and the built environment: urban regeneration as a practice to enhance territorial development. From flagship projects to arts factories. Attractiveness and the city: conflicts and successes in the shared use of space.

workshop 2

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 2	48h	3	Ana Ruiz Bowen	English	■ 100% Project

	Workshop 2 follows Workshop 1 and allows to deepen the technical aspects of the propose The scale of study can go towards precise aspects of dimensioning of construction elemand techniques. The focus is on the building scale.				
	LEARNING OUTCOMES	 Design skills: Using dimensioning skills to confirm the chosen project. Use the technical concepts learned in the thematic courses. Find appropriate techniques to optimize your projects. Critical skills: Be able to present and defend a project. Accept the critics and answer appropriately to a jury. Discover and deepen a thorough knowledge of ecological building problems Begin to propose a sustainable and viable buildingm 			
\	CONTENT	Workshop 2 is based on the same area as in Workshop 1. During the first semester, an urban proposal has been presented. The students will continue working on the same scheme but choosing a building of the proposals. They will deepen all the technical aspects of this construction. The development of this semester work can impact the first proposal. In fact, the process will be cyclical and recurrent between the building scale and the urban scale. At the end of the semester, a presentation will be made to a professional academic panel.			

emergent economy in the city

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTE 2	R Semester 1	15h	1,5	Montserrat Pareja-Eastaway	English	60% Continous Assessment40% Project

	COURSE OBJECTIVES	 Understand key economic concepts Approach the relationship between economy and the local development Learn the functionalities of Business Models
	LEARNING OUTCOMES	 Understand economic elements needed in the planning of a city Identify new practices associated with the emergent economy Understand, produce and reinterpret a Business Canvas Model.
		These lectures will expand of policy interventions and practices in the territory, paying particular attention to new collaborative models developed among creative and knowledge sectors in the city. From networks to governance issues, "Emergent Economy in the City" will focus on identifying innovative practices in companies, sectors, institutions and citizenship issues that aim to counteract the traditional norms and behaviors of urban actors.
æ		Particular attention will be paid to the 'smart specialization' approach that combines industrial, educational and innovation policies to suggest that countries or regions identify and select a limited number of priority areas for knowledgebased investments, focusing on their strengths and comparative advantages. In addition, students will visualize how the triple helix (university, companies and institutions) is articulated in particular evidence-based monitoring and evaluation systems and cases.
ξΞ	CONTENT	'Project ecologies' and the city: the ability to create 'atmospheres' for networking and collaboration: the case of the video games sector
		The emergence of innovative ecosystems: the case of districts of innovation' as tools for urban development
		New cultural centers of production: the case of factories of creativity in Bilbao and Barcelona
		Smart cities and technology: the case of 'co-working spaces, living labs, fab labs and innovative incubators'
		 Urban tourism and attractiveness: the case of gastronomy (from foodies to high cuisine) and fine arts (galleries and festivals)
		Social innovation and urban developments: the case of citizens participation and involvement in the re-use of urban space

green building certification and environmental footprint

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 1	Semester 2	30h	3	Elodie Chebassier	English	40% Continous Assessment60% Project

	COURSE OBJECTIVES	The global aim is to take green building dimension in account for a smart city design
		Know the different green building frameworks
	LEARNING OUTCOMES	Explain the different phases of a certification
		■ Make the connection between technical requirements and environmental footprint.
		The course is organized with lectures and students workshops and oral presentations. First, the students discover by themselves the different green building certifications: Breeam, HQE, LEED, Minergie, Casbee. They have to present them by group and also present the implementation for a building of their choice.
		Then a lecture deals with the importance of the reasons why such frameworks are applied, with an overview of the different stakeholders (project owner, building firms, city). After those two steps, a case study is launched: a program and several competing teams:
\$\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	CONTENT	■ in 2017-2018, teams worked on an international high school planned in the Citadel of Lille)
		■ in 2018-2019, they worked on the same program but in a different place (Humanicités)
		The delivery takes modern forms like videos. This case study obliges the students to read and to understand the precise technical requirements (e.g. energy consumption or green roofs).
		The last lecture focuses on Life Cycle Assessment approach and deals with the different HQE targets (the cerway framework is used, as it is in English language).
	BIBLIOGRAPHY	http://www.breeam.comhttps://www.cerway.com

learning expedition

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 2	Semester 1	27h	2,5	Ana Ruiz Bowen	English	40% Continous Assessment60% Project

		 Be aware of the up-to-date development of sustainable cities in European countries in government policy, urban infrastructure, and green buildings.
(A)	COURSE OBJECTIVES	Case study and site survey in awarded and well known projects in some of the leading smart cities in the world.
		Establish collaboration with overseas universities and industries
		Knowledge in good practice and policy support and economic aspects in successful smart cities and communities.
	LEARNING OUTCOMES	Adapting skills of site survey, data collection, and case based project analysis.
		Application of sustainable planning and design in local and international context.
		This was divide will halve whose in the forms of site winit acceptable and consider Through
\$ ≡	CONTENT	This module will take place in the form of site visit, case study, and seminar. Through the learning activities, students will expand knowledge in government policy and real world practices in the subject, in particular innovation and cutting-edge technology and design method in planning and designing smart cities in Europe and worldwide. Apart from professional skill building such as environmental assessment and site survey in the selected smart projects, students will also compare different smart approaches applied in France and overseas. Transforming basic planning principle and adaptation in different context will also be discussed.
Ŭ−		Urban policy, master planning and infrastructure in smart cities
		Smart grids, optimization and synergic technology in community and neighborhoods
		Case studies of awarded smart/green buildings and technology
		Seminar with local government departments and industry partners
		Academic program with local universities
		Knowledge transformation and adaptation in French cities.

smartgrid and energy management at building scale

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 2	Semester 1	30h	2,5	Benoit Durillon	English	40% Continous Assessment60% Project

	COURSE OBJECTIVES	 Provide to students a comprehensive understanding on fundamentals of power systems operation. Acquire knowledge on smart grids working definitions, associated concepts and its application to electrical systems. Acquire knowledge on the component of smart grids and their functions. Introduce to the students the current state-of-the-art on architectures and operation of smart grids. Get acquainted with the most commonly used communication protocols for smart grid applications.
	LEARNING OUTCOMES	 Acquire in-depth understanding on the evolution of power systems. Have knowledge about smart grid terminology and concepts. Know about challenges and possibilities related to smart architectures. Have knowledge about technology for micro grids and integration of renewable energy, energy storage and electrical mobility. Learn the smart grid applications.
CONTENT	Course Content	 Overview of power systems Smart Grids: components and definition Integration and management of distributed energy resources, energy storage systems and electrical mobility in smart grids Demand Management, smart metering and AMR devices New network architecture and communication protocols in smart grid. Demonstration projects and deployment
	Practical work	■ Technical visits
	Project	Analysis of smart grid case studies from all over the world.
	BIBLIOGRAPHY	 J. Momoh; Smart Grid: Fundamentals of Design and Analysis. Wiley-IEEE Press, March 2012. Md Fakhrul Islam, Amanullah M. T. socio-political approach of the city JNIA HEI

Leve	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTI 2	R Semester 1	15h	1,5	Colette Saba Touzain	English	60% Continous Assessment40% Project

(A)	COURSE OBJECTIVES	To give students the tools for a critical lecture about the elusive concept of smart cities.
	LEARNING OUTCOMES	 Understand how the concept is born, developed and used by several entities (IO, specialists, multinationals, population). Have an overview of a wide range of smart cities in the world (developed and developing countries). Have tools for interpretation and critical evaluation of the concept, its development and its use.
	S1 (3 hours): what is a "smart city"	 Emergence of the concept of smart city (UNESCO, A journey through smart cities), Presentation of the multitude of definitions of smart city (Council definition, specialists, administrators), What is the popular understanding of a smart city (examples based on studies), Explication of cases studies that students will conduct and who aims to prove or not the needs to establish a smart city and its efficiency for the citizen's wellness.
æ	S2 (3 hours): What is a smart city approach for developed and developing country cities	 Different understanding and perception of the concept of smart city between developed and developing countries (The World Bank, Smart City in Developing Countries), Presentation of 4 cases studies, 2 in developed countries and 2 in developing countries (20 minutes for each presentation and 10 minutes debate).
CONTENT	S3 (3 hours): Do we need smart cities?	 Presentation of various points of view, for example the critical view of smart cities raising questions about the commercial interest of large multinational companies (Elke Rauth). Presentation of 4 cases studies on ancient and new intelligent practices in "non smart cities" developed by societies in order to facilitate their daily life (20 minutes for each presentation and 10 minutes debate).
	S4 (3 hours): Smart city or smart society? The case of Beirut	 Presentation (1 hour) of the emergence of the smart city in Beirut: society's initiatives and their limits to achieve the large public. The role of the government in supporting those initiatives. Presentation of 4 cases studies on emerging smart cities (20 minutes for each presentation and 10 minutes debate).
	S5 (3 hours): Conclusion	Elaboration of a summary report on the different notions of smart city, the work will be based on the students' reflexion.

sustainable refurbishment

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 2	Semester 1	15h	1	Stéphane Baly	English	60% Continous Assessment40% Project

Ö	PREREQUISITES	 Thermal transfer Architecture, construction and sustainable design Dynamical thermal simulation and HVAC
	COURSE OBJECTIVES	 Introduction to building refurbishment specificities in comparison to new buildings Presentation of sustainable refurbishment approaches and realizations
	LEARNING OUTCOMES	 Present the building refurbishment specificities Propose refurbishment strategies with a sustainable approach Building simulation and data analyses
\$= \$= \$\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	CONTENT	The course is organized between lectures and field visits. Regarding the material presented within the previous courses (cf. prerequisites), lectures will provide supplementary elements dedicated to refurbishment projects. Case studies with building simulation will be conducted to analyze and criticize sustainable refurbishment approaches.

urban environment principles

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 2	Semester 1	30h	2	Dragan Milosevic	English	50% Continous Assessment50% Project

		■ Thermal transfer
	PREDECUISITES	Architecture, construction and sustainable design
Ö	PREREQUISITES	Principle and future trends in urbanism
		Future cities: smart, inclusive and sustainable
		 Introduction of urban environment topics: urban climate, outdoor air quality, adaptation to climate change in cities
	COURSE OBJECTIVES	Presentation of microclimate simulation
		Introduction to research activities toward engineering students
		■ Understand key urban environment topics
	LEARNING OUTCOMES	Use the basic tools of a climate simulation software
		Identify the local climate of a neighborhood
		■ To learn up-to-date knowledge about ArcGIS
		First, introduction lectures will provide key elements to understand urban environment,
رگم		in relation to major current issues including climate change.
\$ =	CONTENT	 Second, students will take part of a research project focusing on uran microclimate modeling will be introduced during this practical course.
	BIBLIOGRAPHY	 Oke, T., Mills, G., Christen, A., & Voogt, J. (2017). Urban Climates. Cambridge: Cambridge University Press. doi:10.1017/9781139016476

water management, landscaping and green spaces

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 2	Semester 1	30h	2	Didier Larue	English	65% Continous Assessment35% Project

		Introduction to the management of storm water with an ecological approach.
		Understanding the importance of site analysis.
<u></u>	COURSE OBJECTIVES	How to design a master plan which fits to the site and combines an integrated rainwater management.
(4)		Understanding of the relationships between open space network, water management and ecological hydrological continuity.
		Presentation of examples of innovative solutions to manage rainwater in the urban water cycle.
		Understand the way storm water can be managed into a master plan.
	LEARNING OUTCOMES	■ Be able to manage solutions favoring the re-infiltration of water into the subsoil.
	CONTENT	First, the course starts with an overview of storm water management illustrated by a lot of examples, and outstanding "eco-quartier" in Europe.
\$= \$= \$=		Second, the course focuses on an existing project located in Lille which is a relevant example of ecological water management.
		Third, students will take part of a project that aims to perform a master plan located on an existing site. They will have to set up buildings, an integrated water management solution using swales, ponds, percolation and infiltration trenches.

workshop 3

Level	Period	Hours	ECTS Credits	Teacher Coordinator	Language	Assessment
MASTER 2	Semester 1	48h	4	Ana Ruiz Bowen	English	■ 65% Continous Assessment ■ 35% Project

Ġ.	PREREQUISITES	Workshop 1Workshop 2
(A)	COURSE OBJECTIVES	The subject of Workshop 3 is the built environment: conception, design, and performance. The main objective to develop knowledge and understanding of this field.
	LEARNING OUTCOMES	 Have a thorough knowledge of today's urban problems Show his/her capacity of proposing persuasive future sustainable urban spaces in practical terms Design skills: urban design, construction, write a report, run participatory events and workshops, make presentations and exhibitions. Management skills: organize a project team, manage client communication, deliver work on time. Critical skills: understand the project in the wider context of an engineering education and practice.
\$	CONTENT	 Workshop 3 is based on a real site. First, students will visit the site and meet the stakeholders. A functional roadmap will be provided (or compose with students). Secondly, a succession of workshops will allow exchange between professors and students. Students will provide model technical and architectural documentations. They will engage deep reflection and research in their propositions. Finally, a panel will provide advises and critics on their projects.

general information

Master of Science and Engineering Program

Junia ISA (Institut Supérieur d'Agriculture), since 1963, provides life science expertise related to agriculture, agrifood, environmental science, agricultural economics, and landscape.

The key to Junia ISA's pedagogical approach is activating students' ability to connect their theoretical knowledge with real world applications. Through project-based, hands-on learning, Junia ISA graduates grasp the big picture as well as the technical details.

Students pursuing a Master's degree choose from one areas of four specializations:

- Agricultural Science,
- Environmental Science,
- Food Science, or
- Agricultural Economics, Marketing and Management.

The below courses are common to all Master's programs at Junia ISA.

MASTER 1 - FALL SEMESTER	ECTS
Welcome Session	6
French as a Foreign Language	3
MASTER 1 - SPRING SEMESTER	ECTS
French as a Foreign Language	3
Summer Internship	6

MASTER 2 - SPRING SEMESTER	ECTS
Final Internship	30
Six-month Professional Experience	
Written Report and Oral Defense	

welcome session

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	6	Sophie Dupont Wargniez	English

This welcome session is a mandatory course for ALL degree-seeking AND exchange students joining the first semester of Master 1 at Junia ISA.

®	OBJECTIVES AND SKILLS DEVELOPED	This session is an introductory course to the teaching at Junia ISA (scientific skills, communication skills, knowledge on agriculture and food chain). The objectives of the welcome session are to: Get used to the pedagogic methods, expectations and type of evaluations at Junia ISA Introduce the lectures from the 4th year in agriculture and food chains Give reminders on scientific writing and communication methods Get to know each other and prepare to meet future colleagues from 4th year.
CONTENT	LECTURES - WORKSHOPS GROUP WORK Scientific communication (33% of the credits)	 Prepare for future scientific work through a written and oral assignment on scientific topics 8h lectures on the methodology for a literature review/ 22h of work in small groups Evaluation: Individual literature review + Group oral presentation of a press review
	Food chain (33% of the credits)	 How are the food chain organized in the European context? 17h of lectures on food chain organizations / analysis of some specific food chains Evaluation: Individual exam
	Intercultural communication and interpersonal skills (17% OF THE CREDITS)	 Get a glimpse at how cultural differences interact in our relationship and communication with others, and how communication between people works 15h + 12h of workshop + 12 Evaluation: exercises during the workshops + short individual report + participation in the workshops

NOTE: Non French-speaking students will also take 15h of French as Foreign Language course

french as a foreign language

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1 & 2	3	Vira Wannepain	French

This French as a Foreign Language course is mandatory course for all non-French-speaking, degree-seeking students in the Master program. Students are placed according to their French level, as assessed using the Common European Framework.

	OBJECTIVES AND SKILLS DEVELOPED	Develop French language skills in a social context, both written and oral, in order to improve communication: Listening, Reading, Speaking, Writing
\$	CONTENT AND ORGANIZATION	 Written and oral reception activities Conceptualization of linguistic content Training exercises in the classroom and at home Written and oral production: simulation, role-playing, playful activities Final Tasks mobilizing all the skills of a didactic unit
	EVALUATION	Continuous assesment, oral presentations, final exam

summer internship

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	6	Sophie Dupont Wargniez	French or english

All degree-seeking students at Junia ISA must carry out an "assistant engineer internship" (SAI) at the end of the bachelor-level program or Master 1 year.

®	OBJECTIVES AND SKILLS DEVELOPED	The main purpose of this internship, lasting for at least eight weeks (forty days), is to provide an immersion in the professional world in a field of the student's choice. This process of discovery helps to guide students in their future development and build career plans. It gives them the technical and interpersonal skills and knowledge of the business world that are essential for any engineer. The SAI enables students to immerse themselves in a company/sector that interests them, or to assist an executive (not necessarily an engineer) occupying a role they themselves would like to fill. The interns are given one or more missions relevant to the curriculum defined by Junia ISA and approved by the host organization.
() ;;;	CONTENT AND ORGANIZATION	The knowledge and skills to be acquired/developed through the internship may include: Scientific, technical, economic and/or regulatory knowledge about a subject Carrying out an analysis or consultancy mission with the appropriate tools Collecting and processing information and data and suggesting appropriate solutions Reporting information in a relevant way Working as part of a team Using interpersonal skills, adapting to the workplace and demonstrating professional ethics Demonstrating an ability to analyse and summarise Demonstrating initiative and independence Using creativity, ability to anticipate, imagination and a proactive approach The ability to question one's judgement
	EVALUATION	The internship will be evaluated based on the following: The internship mentor's assessment Internship report Validation interview with a referring teacher The internship counts for 6 ECTS points (European credits) of the 60 ECTS points awarded for the fourth year of the engineering course.

department of agricultural science Master of Science and Engineering Program

Junia ISA's Agricultural Science program aims to give students:

- an international view of the issue of agriculture, highlighting certain national and/or regional specificities,
- the necessary tools to manage crop and livestock production, as well as agricultural processes, from ruminant nutrition to distribution channels
- a practical view of site management, thanks to lectures and seminars by experts in the field;
- the methods to manage projects within an international context, with multicultural staff.

MASTER 1 - FALL SEMESTER	ECTS
Welcome Session	6
Project: Food Chains 2 and Initiation to Project Management	6
Ruminant Nutrition and Roughage Systems or Urban Farming	3
Plant Biotechnologies	6
Plant Breeding and Genetics or Precision Livestock Farming	3
Crop Modeling	3
French as a Foreign Language	3

MASTER 2 - FALL SEMESTER	ECTS
Sustainable Agriculture and Smart Farming	30

MASTER 1 - SPRING SEMESTER	ECTS
Animal Welfare: From Consumer Demand to Farm Auditing	3
Biocontrol for Sustainable Crop Mangement	3
Livestock Housing and Building Conception	3
Project in Agriculture	6
Agriculture and Climate Change	3
Global Food Politics	3
Applied Agricultural Sciences to Specialized Crops	3
Livestock Production Systems	6
French as a Foreign Language	3
Summer Internship	6

MASTER 2 - SPRING SEMESTER	ECTS
Final Internship	30
Six-month Professional Experience	
Written Report and Oral Defense	

project: food chains 2 and initiation JNIA ISA to project management

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	6	Hélène Leruste	English

®	MAIN OBJECTIVES	This program is specific to international students (or french students who did not follow the bachelor program at Junia ISA) joining the master program in agriculture or agribusiness. The objectives are to: Discover some agricultural production specific to French or European agriculture (in line with the lecture on food chains included in the welcome session). Study a project in the farming sector. Meet the expectations of the sponsor, with a solution in relation with the demand.
		Understand and analyze a problem.
		■ Define objectives.
	SKILLS DEVELOPED	 Manage a group project (project schedule, anticipation of risks, evaluation of the resources, distribution of tasks, take into account of the constraints)
		Develop relationships in a multicultural context (in the group, with the partners, with the teachers)
		 Self-learning on the main animal and plant productions in France
r C		(e-learning platform) - 24h
	CONTENT	■ 1 workshop on project management - 4h
		■ 1 intensive week on a project in agriculture in subgroups - 5 days
		Evaluation of knowledge on animal and plant production (on-line quiz)
	EVALUATION	■ Group oral evaluation + report on the project in agriculture

ruminant nutrition and roughage JNIA ISA systems

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Joop Lensink Valérie Jacquerie	English

	MAIN OBJECTIVES	Train future animal nutrition managers (formulation, R & D, sales) and breeding advisorsEnhance knowledge on ruminant feed and roughage systems
	SKILLS DEVELOPED	 Identify problems related to feed-imbalanced diets (health, product quality, sustainability) Develop a systematic and systemic approach regarding ruminant farms
()	CONTENT	 Roughage (fodder) systems and grazing management Pasture management and plant variety use Ruminant (feed) systems and sustainability approach Metabolic diseases related to rumination International feed and animal diet evaluation systems
	EVALUATION	■ Written individual exam
	PROGRAM	 Introduction: Ruminant production systems Roughage and conservation methods Pasture and grass management / Productivity of grass / Different species in grasslands Roughage systems Ruminant-specific metabolic diseases Rationing and feed systems (in France and abroad): technical and economic analysis

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Pénélope Cheval	English

	T. Committee of the com	
	MAIN OBJECTIVES	This course is based on the definition of urban agriculture, its context, its typology, its issues and the questions it raises.
	SKILLS DEVELOPED	This class will help you understand the issues and the context in which urban agriculture is taking place. It will also give you an initial overview of the projects carried out and underway in France and around the world and will enable you to understand the setting up of a project in urban agriculture and the associated issues (environmental, social and economic issues, etc.). The questions raised by urban agriculture will also be discussed and will help you understand the research objectives on this theme.
		The following points will be treated:
		Definition
		■ History,
		■ Context,
		■ Issues,
		■ Objectives
c ≙n		■ UF functions,
	CONTENT	■ Forms of UF,
		Projects developed in UF and diversity of actors,
		UF in France and in the world
		Project editing in UF
		■ Economic aspects,
		UF and environment,
		■ Smart Farming and UF
		Research in UF
	EVALUATION	■ Student project + Final Exam at the end of the course
EQ	PROGRAM	The course will be structured around theoretical lessons, interventions by professionals from the field, visits of projects in urban agriculture, a student project and a final exam at the end of the session.

plant biotechnologies

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Pénélope Cheval	English

	MAIN OBJECTIVES	 Improve knowledge on techniques and applications of biotechnologies in crop production Investigate the presence of Septoria leaf blotch resistance genes on different varieties of wheat
	SKILLS DEVELOPED	 To have a general outlook on plant biotechnology principals and application Implementation of experiments integrating biotechnology techniques Management of a mini-project in plant biotechnology (research, bibliography, presentation)
		Lectures, practicals, visits
\$ ==	CONTENT	 Biotechnology application in micropropagation Biotechnology applications to regenerate plants virus-free and in plant breeding (Protoplaste production, Androgyny, embryos culture) Realizing a mini-project

plant breeding and genetics

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Ali Siah	English

	I and the second	
		Acquire a background in the area of plant breeding and plant genetic selection (actors, organization, challenges, progresses, etc.)
(A)	MAIN OBJECTIVES	Understand the strategies and techniques of quantitative genetics applied for plant improvement
		Tools of biotechnology applied for plant breeding such as marker assisted selection and genomic selection
	SKILLS DEVELOPED	Analyze constraints, technical and economic challenges of genetic improvement of various plant species.
		Leccana /conference, company visits
		Lessons/conferences, company visits
		 Organization of plant breeding sector
-^-		,
€	CONTENT	■ Organization of plant breeding sector
♦	CONTENT	 Organization of plant breeding sector Methods of plant breeding
4 ;;;	CONTENT	 Organization of plant breeding sector Methods of plant breeding Quantitative genetics applied for plant breeding
₹ !!!	CONTENT	 Organization of plant breeding sector Methods of plant breeding Quantitative genetics applied for plant breeding Marker assisted selection and genomic selection

precision livestock farming

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Hernaina Andriamandroso	English

(A)	MAIN OBJECTIVES	This course sequence, taught in English, will propose to students an introduction to the new technologies used today in the agricultural sector, on the field.
	SKILLS DEVELOPED	 Knowledge about new aspects and technologies regarding the agricultural techniques. Data analysis: work on huge data sets coming from sensors Self-learning through the case study work.
\$ <u></u>	CONTENT	 The lectures will approach techniques coming from the crop and animal productions. These illustrated techniques will go from environmental or crop and animal health sensors to new mechanization technologies (ie robots). Some information and help decision tools will also be illustrated.

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Sitraka Andrianarisoa	English

		■ Integrate different steps of crop models design
		 Understand formalities used to model different mechanisms occurring
	MAIN OBJECTIVES	in the soil/plant/atmosphere system
		Use crop models to simulate the functioning of agroecosystems
		■ Discover some instances of the use of modeling by farmers
		To be able to interact during the different steps of crop model design: conceptualization, formalization, parameterization, calibration and validation
	SKILLS DEVELOPED	To be able to think about the modeling of multiple processes involved in crop production (soil/plant/atmosphere)
		■ To be able to use some models applied to crop management at farm scale.
		Lectures and concrete cases (36 hours)
		Topic:
		Definition, designing, parameterization, calibration and validation of crop model (8h)
()		
(¥≡)	CONTENT	 Use of some crop models: simulation of agro-environmental performance of different crop management systems (e.g., variation in fertilizer inputs or in crop rotation/association, effect of climate change or soil type in crop production) (8h)
* =	CONTENT	management systems (e.g., variation in fertilizer inputs or in crop rotation/association,
∛ =	CONTENT	management systems (e.g., variation in fertilizer inputs or in crop rotation/association, effect of climate change or soil type in crop production) (8h)
¥= 	EVALUATION	management systems (e.g., variation in fertilizer inputs or in crop rotation/association, effect of climate change or soil type in crop production) (8h) Models for weeds management, crop protection and fertilization (10h)

animal welfare: from consumer demand to farm auditing

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Vanessa Guesdon Hélène Leruste	English

		■ Define what is animal welfare and what influences people's perception of animal welfare
		 Discuss major factors influencing animal welfare with a specific focus on housing, nutrition and management practices (inducing pain)
	MAIN OBJECTIVES	Determine how to evaluate animal welfare on a farm level, set-up and perform a simple audit, and analyze the results
	WAIN OBJECTIVES	Know how (European) legislation in animal welfare is constructed and what are the main aims of legislation
		Realize what is the market situation in terms of animal welfare-friendly products and the ways to increase the market
		■ Discuss future evolution in terms of legislation, situation for farmers and global markets
		Set-up (simple but valid) animal welfare scoring protocols
	SKILLS DEVELOPED	■ Analyze results of a farm audit
		Capacity to anticipate future evolution
		■ Welfare definitions
(\$ <u>=</u>	CONTENT	Factors influencing animal welfare
<u>v –</u>)		Legislation and future evolution
	EVALUATION	■ Oral presentations in group, Final exam

biocontrol for crop protection

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Jérôme Muchembled Ali Siah	English

	MAIN OBJECTIVES	 Understand the modes of action of biocontrol products. Integration of biocontrol products in cropping systems and agronomic advice. Know the organization and different actors of biocontrol area.
	SKILLS DEVELOPED	 Identify different categories of biocontrol and understand the sector Identify available biocontrol products for plant protection and crop production (arable crops and specialized crops) Understand how a biocontrol product operates in the environment
		 Biocontrol area and the current context of crop protection in relationship with sustainable agriculture and agroecology.
\$= **=	CONTENT	 Description of the different categories of biocontrol products (macro-organisms, micro-organisms, semiochemicals and natural substances). The biocontrol sector (Research & Development process, companies, marketing process, regulation, field use, etc).

livestock housing and building conception

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Joop Lensink	English

		 Gain knowledge and analyze the different aspects related to livestock housing influencing the animals' performances
	MAIN OBJECTIVES	 Go through all steps of a project by the realization of dairy barn building project for a farmer
		■ Advise farmers on building aspects and project
		■ Realize a building quality audit
		Conceptualize a cattle building project
	SKILLS DEVELOPED	■ Advise farmers on building aspects and project
		Realize a building quality audit
		 Knowledge on animal needs, human constraints, administrative and legislative aspects, environmental regulations related to livestock building
		■ Future evolution in this area specifically in terms of innovation
(1)	CONTENT	■ A major part of the knowledge on the topic of this module will be gained through the farm building project. The first visit will concern a dairy farmer that has a construction project; either a complete new building or an extension of an existing one. Students will have to identify the wishes of the farmer, the environmental, legislative and administrative constraints and realize finally building plans and budget plans for the project. The work will be evaluated through an "advisory" report and oral defense in front of the farm and an expert from the "farm building service" of the Chamber of Agriculture.
		Case study analysis with synthetic note to be written (20%)
	EVALUATION	■ Report on the building construction project (60%)
		Oral presentation (45 min) by the groups of on their building project
	Session 1	■ Lecture: Introduction to livestock housing, animal behavior, basis of housing (4h)
	Session 2	■ Visit: dairy farm with construction project (4h)
	Session 3	Lecture: resting, feeding and thermal requirements (8h)
	Session 4	- Leotare. resting, resulting and thermal requirements (on)
<u>::</u> €	Session 5	■ Free session: construction project (4h)
PROGRAM	Session 6	■ Lecture: environmental legislation, storage capacities of manure (4h)
	Session 7	■ Lecture: building concepts and automatization (4h)
	Session 8	■ Lecture: dairy calves housing and innovation (4h)
	Session 9	■ Visit: building concepts in several species (4h)
	Session 10	■ Lecture: ventilation and climate control (4h)

project in agriculture

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	6	Eric Taisne	English

®	MAIN OBJECTIVES	 Study a project in the farming sector, in answer to the request of a partner (farmer or professional working in connection with farms) Meet the expectations of the partner, with a solution in relation with the demand.
	SKILLS DEVELOPED	 Understand and analyze a problem. Define objectives. Manage a group project (project schedule, anticipation of risks, evaluation of the resources, distribution of tasks, take into account of the constraints) Develop relationships in a multicultural context (in the group, with the partners, with the teachers)
\$= \$= \$=	CONTENT	 11 days dedicated to the study, including one whole week. Projects presentation, choice of the groups and the affectation of the projects
	EVALUATION	Intermediate evaluation after 3-4 workweeksFinal oral evaluation in the presence of the partner, written report

agriculture and climate change

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Hélène Desmyttère	English

	Agriculture is simultaneously co-responsible for climate change (emission of greenhouse gases etc) and a victim of climate change (variations, sometimes extreme, of temperature and rainfall, for example!
MAIN OBJECTIVES	Therefore, farming systems need to reduce their impacts and adapt themselves but can also become one of the major solutions for it! Based on these elements, the main objectives of this course will be to:
	Understand climate change challenges regarding agriculture: agriculture's contribution, adaptation and mitigation.
	 Discover concrete and innovative projects or tools for monitoring the impact of farming systems (crops and livestock) to adapt/improve them.
	 Understand environmental and sustainable development challenges
SKILLS DEVELOPED	■ Use environmental analyses tools
	■ Critical thinking (reconsideration) and curiosity
	■ Fundamentals on climate change and understanding of the relationship with agriculture
CONTENT	■ Impacts and practices' assessments tools
	■ Presentation of concrete research and development projects
EVALUATION.	 Presentation of concrete research and development projects Individual written exam
EVALUATION	
EVALUATION	■ Individual written exam
EVALUATION	■ Individual written exam ■ Group oral presentation
EVALUATION	 Individual written exam Group oral presentation Lecture: Fundamentals on Climate Change
EVALUATION	 Individual written exam Group oral presentation Lecture: Fundamentals on Climate Change Lecture: What link between climate change and agriculture?
EVALUATION PROGRAM	 Individual written exam Group oral presentation Lecture: Fundamentals on Climate Change Lecture: What link between climate change and agriculture? Lecture: Tools for carbon footprint calculation/diagnosis
	 Individual written exam Group oral presentation Lecture: Fundamentals on Climate Change Lecture: What link between climate change and agriculture? Lecture: Tools for carbon footprint calculation/diagnosis Lecture: Diagnosis at the farm scale
	 Individual written exam Group oral presentation Lecture: Fundamentals on Climate Change Lecture: What link between climate change and agriculture? Lecture: Tools for carbon footprint calculation/diagnosis Lecture: Diagnosis at the farm scale Visit: Impact of climate change on crops
	 Individual written exam Group oral presentation Lecture: Fundamentals on Climate Change Lecture: What link between climate change and agriculture? Lecture: Tools for carbon footprint calculation/diagnosis Lecture: Diagnosis at the farm scale Visit: Impact of climate change on crops Lecture: Livestock farming adaptation

global food politics

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Eric Taisne Sabine Weiland (ESPOL)	English

	MAIN OBJECTIVES	Food covers immense terrain. It is at the intersection of competing issues such as production, consumption, supply chains, trade, government and politics, science and technology, nutrition, public health, environment, ethics, culture, social justice and many more. In this array, it is particularly difficult to design food policy on various levels and among diverse actor groups and demands. In this course, we will explore the contemporary global food system, the past, and possible futures for food policy.
		We will cover a number of core problems, such as food policy and governance, food production and consumption, food security and safety, health and the environment, food behavior and culture, and food poverty and justice.
()	CONTENT	The course is taught through 12 lectures of 2 hours each. Each session contains also interactive elements, and students are encouraged to actively participate, ask questions and discuss issues of common interest. The lectures are designed to outline the topic in general, highlight illustrative examples and discuss some salient points. They are meant as an introduction to the topic at hand which enables the students of further self-study. You are required to read the basic literature (see "Basic reading" in session overview)
		in preparation of the sessions.
	EVALUATION	Regular attendance of the sessions is a requirement.Exams: 3 hours written exam (essay).
	Session 1	■ Introduction: The Geopolitics of Food
	Session 2	■ Food as a Policy Field
	Session 3	■ Food Governance
	Session 4	■ Food Governance
<u> </u>	Session 5	■ Food Production and the Global Food Chain
PROGRAM	Session 6	■ Food Security
	Session 7	■ Food and the Environment
	Session 8	■ Food, Ethics and Culture
	Session 9	■ Food, Poverty and Social Justice
	Session 10	■ The Future of Global Food Politics

applied agricultural sciences to specialized crops

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Pauline Trapet	English

		Identify the specialized crops, the different production areas, the markets and the possible valorization of these plant productions (fruits and vegetables).
		Know the biological and botanical characteristics of the French specialized crops.
		■ Understand the importance of phenological stages in relation to the technical itinerary.
	MAIN OBJECTIVES	■ Understand and analyze a technical itinerary: varietal choice, soil and sowing; fertilization and piloting tools; chemical and mechanical management of the main weeds; chemical and biological management of major diseases; chemical and biological management of major insects; decision support tools to manage bio-aggressors; harvest, quality and regulation.
		 Understanding the quantitative and qualitative issues of specialized crops for food and health
	SKILLS DEVELOPED	 Analysis of technical itineraries in relation to production methods and the regional pedo-climatic context
		■ Identification of the main biotic and abiotic stresses of specialized crops
		News, evolutions and innovations of technical itineraries applied to specialized crops:
رڪي		■ Arboriculture (Apple orchards)
v= v= co	CONTENT	Grape vine
		Vegetables production
	EVALUATION	 Individual assessment (50 or 100%) and/or oral presentations by groups (30 minutes) (50 or 100%)

livestock production systems

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	6	Valérie Jacquerie Hélène Leruste	English

	MAIN OBJECTIVES	 Enhance knowledge on cattle, sheep, pig and poultry farming techniques in France and abroad Identify the actors in these sectors Understand the issues and developments in the sector
	SKILLS DEVELOPED	 Production systems/markets (meat and milk) Analysis of technical and economic results Systemic approach to Livestock Production and Organization Compare breeding methods in different European countries
} ;;;	CONTENT	 Ten sessions: Courses/conferences, Visits + self-managed and personal work. Topics: Breeding of suckling cattle, pig breeding, breeding laying hens, sheep-goat farming One Week: Study mission of 2-3 days, with preparation and restitution. Topic: Study of a theme according to destination (e.g. environment and competitiveness in the Netherlands).
	EVALUATION	■ Oral defense in group – Written report.

specialization: sustainable agriculture and smart farming

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	30	Bertrand Vandoorne Herinaina Andriamandroso	English

		The main objectives of this specialization are to understand new issues in agriculture and develop a working method to accompany farmers and companies in their changing environment.
		■ For the next year: to be operational in the support of farmers.
(A)	MAIN OBJECTIVES & PROFESSIONAL SKILLS	For the next 40 years: to be an actor of sustainable agriculture through diverse sectors and territories.
(1)	DEVELOPED	This specialization will train students to:
		Discover, understand and analyse innovative and sustainable agronomic methods in animal and plant production
		Understand and manipulate the technologies of digital agriculture at the service of the sustainability of agricultural systems.
-0-		Different teaching modules (for 50 days) will be organised by the teachers of Junia ISA's Department of Agricultural Science with numerous professional guest lectures. The objective is to span the different environmental, technical and economic approaches in animal and plant production.
3 :::	CONTENT	A development and innovation project (for 40 days) will be assigned to students in partnership with a company or organization. This project corresponds to a real demand and the students (in groups) are in a situation of obligation of result.
		For some groups, according to the needs of the project, students from partner schools Junia HEI and/or ISEN will also be able to bring their skills to solve the problem.
	Tools for supporting farming and farmers:	■ Farm strategy, consulting and projects (10 days)
	Agriculture and society:	■ Societal issues around technology (5 days)
<u>⊡</u> Q TRAINING		■ Agriculture and Water (5 days)
MODILLES	Professional skiller	■ Agriculture and territories (3 days)
	Professional skills:	■ Innovative and sustainable cropping systems (10 days)
		Precision Agriculture (20 days)
	Group project	■ 40 days

department of environmental science

Master of Science and Engineering Program

Junia ISA's Environmental Science program aims to give students a general overview of:

- Prevention of soil pollution
- Water and air pollution
- Management and treatment of sites contaminated by human activities
- General assessment of pollution,
- Remediation/treatment of polluted sites (bioremediation, phytoremediation, biotechnology, and more)

MASTER 1 - FALL SEMESTER	ECTS
Welcome Session	6
Field Study in Environment	6
Environmental Pollutants	3
Toxicology - Ecotoxicology	6
Pollutant Behavior in Abiotic Matrices	3
Waste Management	3
French as a Foreign Language	3
French as a Foreign Language	3

MASTER 2 - SPRING SEMESTER	ECTS
Final Internship	30
Six-month Professional Experience	
Written Report and Oral Defense	

field study in environment

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1 & 2	6	Nadège Oustrière	English

(A)	MAIN OBJECTIVES	Manage, in a collaborative work, a long study dealing with an environmental issue.
	SKILLS DEVELOPED	 Use project management tools; Deliver your work in a strict and professional way; Understand and respond to a company issue; Technical skills, depending on the topic of the project.
\$!!!	CONTENT	 Eleven (11) days dedicated to the study, including one whole week. Project presentation, choice of the groups and the project assignment.
	EVALUATION	Intermediate evaluation after 3-4 work weeksFinal oral evaluation in the presence of the partner, written report

environmental pollutants

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Julien Castelin	English

It is highly recommended to take this course with Pollutant Behavior and Toxicology-Ecotoxicology

	MAIN OBJECTIVES	 Understand the main issues linked with contaminated areas and the main challenges to face Know the major pollutants in the environment Learn the main characteristics of such pollutants
	SKILLS DEVELOPED	Be able to identify links between activities and pollutionPractice collaborative group work: work, oral presentation, written report
\ }:::	CONTENT	The physical environment of Western countries (air, water and soil) has been affected by a wide range of pollutants for centuries. Localized pollution from anthropogenic sources has been observed since the time of the Roman Empire. However, extensive pollution of the environment was a characteristic of the industrial revolution and major and widespread impacts have been observed throughout the nineteenth and twentieth centuries. Contaminated sites are the legacy of a long period of industrialization involving inconsiderate production and handling of hazardous substances and inadequate dumping of wastes. The expansion of industry and the increasing amount of industrial wastes have led to considerable environmental problems that apply in all industrialized countries. Nowadays, developing countries have to face the same problems. This course will provide basic knowledge on main pollutants and their sources. Focus on specific pollutants and specific issues worldwide will be addressed as well.
	EVALUATION	 Students will have to work both on a group project and an individual project: Group Project: students will have to identify on their own pollution and pollutants associated with activities they will discover during on field visits. A written report will have to be realized. Individual Project: students have to work individually on a specific project: introducing the problem of soil and/or water pollution in their own country: students must focus on some typical pollution or areas with specific problems; or exploring an existing management situation of a polluted area (case study) in their own country. Each student will have the opportunity to present his work in front of the class, based on a PowerPoint presentation. Finally, an individual written exam will be organized to verify acquisition of the essentials of the teaching unit.

toxicology - ecotoxicology

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	6	Nadège Oustrière	English

It is highly recommended to take this course with Environmental Pollutants and Pollutant Behavior

®	MAIN OBJECTIVES	 Understand the fate of pollutants in biotic matrices (bacteria, plants, animals); Get the basis on toxicology and ecotoxicology; Integrate this knowledge in ecosystems. Understand and use results from exposure and bioaccumulation experiments; results from ecotoxicological experiments with non-standard test species; results on the effects of chemicals on food-web.
	SKILLS DEVELOPED	 design in vivo bioassays to assess effects on behaviour of organisms; interpret the results of chemical fate and ecological models; interpret data from microcosm and mesocosm experiments; perform an advanced data analysis on chemical and biological monitoring data; perform advanced exposure, effect and risk assessments of chemicals in ecosystems
√ 111	CONTENT	This course will first focus on the fate of toxic compounds and their effects on animals and plants from single individuals to populations and ecosystems. It is organized in lectures dealing with the: main exposure routes (inhalation, ingestion, contact); mechanisms of bioconcentration, bioamplification and bioaccumulation; main mechanisms of pollutant toxicity; main mechanisms of pollutant detoxification; effects on populations and ecosystems. Then, a focus will be done on Environmental risk assessment. ERA is a process for estimating the likelihood or probability of an adverse outcome or event due to pressures or changes in environmental conditions resulting from human activities.
	EVALUATION	Individual written exam and oral group presentation

pollutant behaviour in abiotic matrices

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Nadège Oustrière	English

It is highly recommended to take this course with Environmental Pollutants and Toxicology-Ecotoxicology

®	MAIN OBJECTIVES	 Understand the main chemical reactions between pollutants and chemical species in the contaminated matrices (soil, sediment, water) Comprehend the complexity of chemical processes
	SKILLS DEVELOPED	 Read an analysis report and extract the most relevant information; Discuss data on the analysis report (agronomic and physico-chemical properties); Develop ideas to participate to the elaboration and set up of strategies to evaluate the environmental availability of metallic and organic pollutants. Evaluate, analyze and, from a theoretical point of view, predict the behaviour of pollutants in soils and the main retention and depollution processes which are active in the soil-water system.
\$	CONTENT	 the main chemical reactions between pollutants and chemical species in the contaminated matrices (soil, sediment, water) the students will be able to link the behaviour of xenobiotics in the soil-water system to the physical and chemical characteristics of both pollutant and soil/sediment under investigation, to report on specific themes related to the fate of pollutants into soil and water, and to approach scientific reports dealing with the evaluation and assessment of pollution phenomena in the soil and water environment
	EVALUATION	Individual written exam and written report

waste management

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Johanne Géa	English

It is highly recommended to take this course with Environmental Pollutants and Toxicology-Ecotoxicology

®	MAIN OBJECTIVES	 Acquire basic knowledge, and fundamental benchmarks in the area of waste management; Knowing the context, environment, actors, and tools dedicated to waste management; Get a "waste management" culture to be able to understand waste management study on company scale or for household waste management; Integrate elements of understanding, related to the Circular Economy. This teaching unit is focusing on Waste management tools, on their complete cycle, from production to treatment facilities including the steps of pre-collection, collection, transfer and transport.
	SKILLS DEVELOPED	 Analyze equipment and results of waste management practices; Set-up waste management solutions, technically, economically and in terms of communication; Integrate elements of understanding, related to the Circular Economy.
\ }!!	CONTENT	 The idea is: to get used to the fundamentals (terminology, treatment types, regulations, technico-economic approach) of household waste and waste of economic activities; to develop a type of waste, or sector, or a treatment process, through a case study; to visit a rather complete panel of processing plants (dumping sites, incinerators, recycling companies)
	EVALUATION	Written report in group Group oral defense Individual written exam

geographical information system (gis) - basic knowledge

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Sébastien Détriché	English

		■ The learning outcomes are to acquire basic skills on GIS by using the QGIS software (free and open source):
		understanding different GIS fields of application;
		mastering the basic tools of the QGIS software;
(\bigcirc)	MAIN OBJECTIVES	understanding data (vector and raster) and metadata, deal with spatial data;
\UZ		making of thematic maps (with review of cartography rules);
		knowing how and where acquiring data (data sources);
		learning how to solve environmental problems and apply GIS solutions (polluted sites, soil science, agriculture, landscape management)
		■ Know how to use a GIS software (QGIS)
	SKILLS DEVELOPED	■ Use GIS to deal with environmental issues
	1	
		Guided step-by-step practical work on the software with exercises. Students will work with worldwide and regional (Nord-Pas de Calais) data.
		What is a GIS? How to deal with spatial data? Fields of application, basic knowledge about GIS
-0-		■ The QGIS interface. Dealing with layers and their properties (graphic and attributary),
7		coordinate systems
\$ = = =	CONTENT	coordinate systems The table of contents, toolbars, definition queries
	CONTENT	
3 :::	CONTENT	■ The table of contents, toolbars, definition queries
\$\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	CONTENT	 The table of contents, toolbars, definition queries Symbology and labelling
\$= \$= \$= -	CONTENT	 The table of contents, toolbars, definition queries Symbology and labelling Georeferencing, coordinate systems
\$== \$== 	CONTENT	 The table of contents, toolbars, definition queries Symbology and labelling Georeferencing, coordinate systems Editing and layout (creating maps)
		 The table of contents, toolbars, definition queries Symbology and labelling Georeferencing, coordinate systems Editing and layout (creating maps) Making selections Joining data (from the database to the GIS)
	CONTENT	 The table of contents, toolbars, definition queries Symbology and labelling Georeferencing, coordinate systems Editing and layout (creating maps) Making selections

soil quality investigation consultancy tools

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Julien Castelin	English

®	MAIN OBJECTIVES	 To provide knowledge on soil quality investigation, through an exploration of general approaches in this field, and through a comparison of 2 specific approaches: the Dutch one and the French one. Understand the main issues and goals linked with soil investigations; Be aware of different kind of sampling methods and equipment; Learn about conservation methods and about main analytical techniques.
	SKILLS DEVELOPED	 Be able to build a financial and technical proposal for a classical pollution diagnosis case; Be able to make interpretations and evaluations based on the analysis reports; Technical skills in the field of soil quality investigation (sampling tools) Practice collaborative group work.
	Lecture about French approach on soil quality investigation	■ This lecture will first give a definition of the goal of investigation in the French approach. The different kind of sampling strategies will be presented, and the way to choose the type and the number of chemical analyses that have to be done. A lot of real cases and examples will be brought to the students during this lecture in support.
	Lecture about Dutch approach on soil quality investigation	 Those lectures will first propose an introduction to soil pollution problems in the Netherlands. Then, the soil protection policy and legislation in the Netherlands will be highlighted. Next, a definition of the goal of investigation in the Dutch approach will be given. Then, the standard protocol for preliminary soil quality investigation will be detailed. The different kind of sampling strategies will be presented, and the way to choose the type and the number of chemical analyses that have to be done. During the final part of this lecture the techniques for writing a summary report will be presented and the case study will be introduced.
CONTENT	Case study – soil investigation "Garage de Vries"	■ Following those first lectures, students will have to work on a specific case study. Students will be split in different groups and will have to play the role of young engineers working in a consulting agency (One group of students = one consulting agency). Based on the same document introducing the site, each group will have to build the best proposal (from the technical and financial point) according to the customer needs. This proposal, presenting a sampling plan with the different drillings and chemical analysis proposed, will have to be justified and explained during a short oral presentation. There will be opportunities for class comments/feedback/discussion after each presentation. The exercise will have to be done using both the French and Dutch methodology. An open discussion about the main differences observed will then be done with the students.
	Lecture on soil quality standards and risk assessment & interpretation of the results of chemical analysis	 During these last lectures within Dutch framework, the topics of soil quality standards and interpretation of results will be presented and discussed.
	Field visit: On-going soil investigations	Students will have the opportunity to visit a site where soil investigations are held. This will be a good opportunity to observe the way this is done and the drilling and sampling equipment.
	Study tour (to be confirmed)	 Cooperation with AVANS Breda and TAMPERE Finland The cooperation will consist of a two day project case, scheduled in January. The detailed content will be updated in due time.
	EVALUATION	Group oral presentation and individual written exam based on the lectures.

applied statistics to environment

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Karin Sahmer	English

1	
MAIN OBJECTIVES	 Gain methods for the analysis of environmental data with the statistical software R. Become autonomous in the management of environmental data acquired during an internship. Understand how your statistical skills will deepen the understanding of your data
SKILLS DEVELOPED	 Learn how to use the R software. Gain basic notions in inferential statistics. Learn how to select the right statistical methods depending on your hypothesis. Understand the limits and the conditions for applying those statistical methods. Run statistical methods on data sets.
CONTENT	Lectures followed by practical work using computers The studied statistical analysis will be: Analysis of variance (ANOVA) with 1 or 2 factors Analysis of Covariance (ANCOVA) Linear regression, simple and multiple Principal component analysis

human risk assessment

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Aurélie Pelfrêne	English

	MAIN OBJECTIVES	Know the difference in meaning of the terms "hazard" and "risk", the purpose and the four steps of risk assessment,
		Know the most common routes for absorption of substances into the body,
		Have an understanding of integrating the results of hazard identification, hazard characterization, and exposure assessment,
(A)		Be familiar with the problems in extrapolating the results of studies of the harmful effects of substances from animals to humans and know what are the main sources of hazard information on commercially available substances,
		Understand the principles of exposure assessment,
		Know some of the common approaches to minimizing risk,
		Know how to progress from risk assessment to risk management.
	SKILLS DEVELOPED	Introduction to: human risk assessment concepts, risk calculation (from theory to practice), computerized models for assessment of contaminated land exposure
		Human risk assessment concepts:
ර ිත		Human risk assessment concepts: Definitions: hazard, exposure, risk, dose-response, risk perception, risk communication, risk characterization.
♦	CONTENT	Definitions: hazard, exposure, risk, dose-response, risk perception, risk communication,
4	CONTENT	 Definitions: hazard, exposure, risk, dose-response, risk perception, risk communication, risk characterization.
\$	CONTENT	 Definitions: hazard, exposure, risk, dose-response, risk perception, risk communication, risk characterization. How to carry out risk assessment? Risk assessment process
		 Definitions: hazard, exposure, risk, dose-response, risk perception, risk communication, risk characterization. How to carry out risk assessment? Risk assessment process Sources of uncertainty in risk assessment
	CONTENT	 Definitions: hazard, exposure, risk, dose-response, risk perception, risk communication, risk characterization. How to carry out risk assessment? Risk assessment process Sources of uncertainty in risk assessment From risk assessment to risk management
		 Definitions: hazard, exposure, risk, dose-response, risk perception, risk communication, risk characterization. How to carry out risk assessment? Risk assessment process Sources of uncertainty in risk assessment From risk assessment to risk management Individual evaluation: written test about the lecture
	EVALUATION	 Definitions: hazard, exposure, risk, dose-response, risk perception, risk communication, risk characterization. How to carry out risk assessment? Risk assessment process Sources of uncertainty in risk assessment From risk assessment to risk management Individual evaluation: written test about the lecture Group evaluation: oral presentation (group project on a case study)
		 Definitions: hazard, exposure, risk, dose-response, risk perception, risk communication, risk characterization. How to carry out risk assessment? Risk assessment process Sources of uncertainty in risk assessment From risk assessment to risk management Individual evaluation: written test about the lecture Group evaluation: oral presentation (group project on a case study) Lecture

waste water management

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Julien Castelin	English

	1	
	MAIN OBJECTIVES	Upon completion of this course students should be able to understand the big challenges that companies have
		to face in:
		■ the reduction of the water use,
		■ the management of the waste water,
		■ the re-purposing of treatment by-products.
1	SKILLS DEVELOPED	Both technical skills and operational skills.
	CONTENT	The course will be illustrated with short practical exercises, to be performed by students,
		and on-site visits (waste water treatment plant of municipality and company).
~~ <u>_</u>		The lectures will address the following topics:
(<u>\$</u>		■ Industrial water management;
ر—ک		Wastewater treatment: principles and implementation;
		Water reuse, re-purposing of by products, and case studies;
		Industrial wastewater specific treatment: principles and implementation.
	EVALUATION	■ Individual written exam based on the lectures and case studies done

water and sediment management JNIA ISA

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	6	Julien Castelin	English

		Learning outcomes:
	MAIN OBJECTIVES	Understand the main issues and challenges about water and sediment pollution, in France and in Europe
		■ Learn about the French and Dutch specific approaches on this topic.
		■ Practice collaborative group work: work, oral presentation, written report
	SKILLS DEVELOPED	■ Perform GW monitoring and sampling operations
		■ Analyze survey reports, maps and data
	The course will include many di of field visits, in France and in th	fferent lectures about this topic, from different actors, showing different perspectives + a lot ne Netherlands.
∰ ⇒= CONTENT	Water management	 Specific cases of Water Management: Example of Friesland region in The Netherlands (lecture from Friesland region water board + boat trip). At the European Level: presentation of Integrated Management of Water Resources (lectures and serious game) Sustainable Water Technology: visit of WETSUS center of excellence for water technology (Leeuwarden) + CEW (Center of Expertise Water Technology) About Groundwater topic: field visit (groundwater sampling tools) + practical (groundwater quality)
		Other field visits (visit of the biggest groundwater pumping facility of The Netherlands)
	Sediment management	 Specific approach of sediment management in The Netherlands: lectures and field visits (dredging work/deposit places/sludge treatment facility)
		Specific approach of sediment management in France: lectures and field visits.
	EVALUATION	Practical in lab, group assignments and individual written exam based on the lectures, visits.

audit practices

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Julien Castelin	English

	MAIN OBJECTIVES	The learning outcomes of this teaching unit are to train students in audit practices and for them to understand the different types of audits (internal, external, follow-up, renewal etc).
	SKILLS DEVELOPED	The main skills developed are: Organizational management of an audit: Planning, opening meeting, carrying out the audit, closing meeting, audit report Soft-skills learned during the audit: active listening, goodwill, advice Analytical mind Typology of deviations
4	CONTENT	 The key steps for a successful audit will be introduced and discussed The teaching unit will combine theoretical lectures, based on internal audit standard NF EN ISO 19011 and case studies. The most popular ISO standards (Quality management, Environmental management) will be used to train students. Students will have the opportunity to lead their own audit.
	EVALUATION	■ In groups, students will conduct an internal audit.

specialization: sustainable management of pollution

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	30	Julien Castelin	English

	OBJECTIVES & SKILLS DEVELOPED	The learning approach of the program is essentially multidisciplinary, dealing with the management of contaminated sites from the technical, scientific, economic and sociological angles. The specific objectives of this semester are to provide students with knowledge on: Pollution treatment techniques (treatment of water, effluents); The different remediation techniques (physico-chemical treatment, bioremediation, phytoremediation) Social management of contaminated sites and selected management methods (social acceptance, socially positive use of the restored site, integration of the surrounding populations in the rehabilitation process); Economic evaluation of management methods (cost evaluation, choice of alternative uses for contaminated areas) Possible rehabilitation methods (spatial planning, landscape management)
		The academic Semester (September to end of January) is composed of:
		 A two-week study tour with our partner university 'University of Chemistry and Technology' in Prague (September);
		■ Multiple courses, case studies, group work, site visits,
	CONTENT	 Participation to professional and/or scientific conferences, in France or abroad, in which students will be able to meet the actors involved in management of polluted sites and soils, whether from the scientific or professional world and thus develop their network; Self-directed time slots for the Semester project or the various projects included in diffe-
		rent teaching units.
		The courses are mainly provided by specialists, professors or professional experts working in the different areas of interest of the program.
		The second semester of the program corresponds to the end-of-study internship (30 ECTS), which student can carry out in a company, consulting firm, research laboratory, in research and development, etc. in France or abroad.
	EVALUATION	Continuous assessment (individual & group) and individual written exams at the end of the semester For the Semester project: Oral defense, final written report and evaluation done by the "client"
		■ Physical and chemical treatment techniques
	Applied techniques of pollution remediation	■ Biological treatment technique
	- Political Fortical action	■ Phytoremediation
	Sustainable management of polluted areas	 Alternative use of polluted sites & sustainable management of polluted areas Ecological restoration & landscape management
TEACHING UNITS	Applied Statistics	■ Computer and statistical tools
(5 modules)		■ Professional semester-long project
	Project Management	Responsibility: promotion/communication/sustainable projects
	Assistant Engineer Internship	credts allocated to the defense of the internship report

In addition, French as a foreign language courses are proposed to English-speaking students, as well as business English courses to French-speaking students through the whole academic semester spent at Junia ISA.

department of food science

Master of Science and Engineering Program

Junia ISA's Food Science program aims to give students:

- an international view of food safety regulations and standards, highlighting local and international specificities,
- tools to assist food companies in setting up systems (HACCP, BRC, IFS, SQF, ISO 22000, FSSC 22000, ISO 14001 and ISO 9001) and performing audits (preparation for internal auditor certification exam),
- an overview of theories, concepts and methodologies of company resource planning systems,
- a practical view of food industry management, through lectures and seminars by professionals of the sector,
- methods to manage projects in an international context, with multicultural staff.

MASTER 1 - FALL SEMESTER	ECTS
Welcome Session	6
Food Tech Project - Introduction	6
Quality Assurance and HACCP	3
Unit Operations	6
Data Analysis and Applied Statistics to Agrofood	3
Bioprocess	3

Written Report and Oral Defense	

food tech project - introduction

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	6	Vincent Dumortier Emmanuelle Martin	English

		-56.
	MAIN OBJECTIVES	 Refresher course in biochemistry and food microbiology. Acquisition of laboratory techniques.
®		Mobilize knowledge and skills in food science to resolve a concrete technical issue presented in a professional setting. The project will be presented in the form of a problem arising in an industrial context (either an exterior sponsor or at Junia ISA with a link to an external study).
SKILLS DEVELOPED		Work in a team with colleagues and in collaboration with the school or partner firm and use project management tools.
		■ Produce results in a rigorous and professional manner.
		■ Around 100 hours dedicated to the projects
		Around 100 hours dedicated to the projectsMicrobiology: class, practicals, case study
رک م		
	CONTENT	■ Microbiology: class, practicals, case study
4 :::	CONTENT	 Microbiology: class, practicals, case study Biochemistry: class, practicals, case study

quality assurance and haccp

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Caroline Kaczmarek	English

(MAIN OBJECTIVES Understand the concept of quality, its added value and impact Understand how to define quality in a particular context	
	SKILLS DEVELOPED	 Identify links between food regulations and HACCP Create a process diagram: description of the purpose and benefits of process mapping Develop the HACCP methodology
()	CONTENT	The principles of quality and of the HACCP methodology. Lectures, tutorials and company visit. What is quality, what are the principles of quality, how to develop a quality management system? Focus on ISO 9001, quality standards, labels and strategies Continuous improvement and problem solving tools Presentation of the food hygiene package Process mapping: SIPOC, Top Down, Functional Deployment approaches Study of the prerequisite programs HACCP: 12 steps for 7 principles.
	EVALUATION	■ Written reports

unit operations

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	6	Alexandre Berth	English

	MAIN OBJECTIVES	Unit Operations in Agri-Food Engineering deals with the design and selection of process equipment or process plants. Each piece of equipment that could be combined to make a "unit" in a process should have a clearly defined function. For example: mixing, separating solids and liquid, separating mixtures from fluids, size separation of solid particles, or transport of a fluid. The number of the most important and basic Unit Operations is not very large and are governed by the fundamental laws of mathematics, physics, chemistry, and mechanics, which provide an approximate description of the real processes. The 'Unit Operations' concept allows for the analysis of unit operations in terms of fundamental principles such as mass and energy balances, phase equilibria, and transport of momentum, energy and mass. In this course we examine a systematic way of approaching design and selection of process equipment.
	SKILLS DEVELOPED	 Name the main unitary operations used in the industry, give specific definitions of them and sort them into relevant categories. The operations evoked in the course are sterilization, frozen, filtration, drying, atomization (spray drying). Name several precise examples of industrial applications for each unitary operation Describe precisely the working principle of each unitary operation both at the macroscopic scale (in flow, out flow, energy flows) and at the microscopic level (particle, interface, molecule). This description will concern both the physical and chemical phenomena involved and the thermodynamic and kinetic constraints that dictate the separation. Identify to operating parameters that determine the efficiency of each process Calculate mass and energy balance for discontinuous, semi-continuous and continuous processes and dimensioning the facilities that allow to perform them Re-write and interpret the main mathematical developments that lead to the useful equations for process dimensioning and remember at the same time what are all the simplifying hypotheses that must sometimes be used to establish models and dimensioning methods. Apply empirical, analytical and graphical methods classically used for unitary operation dimensioning. Gather information (field visits, literature search, interviews, etc.) on a unitary operation involved in an existing industrial process and elaborate a critical analysis of this step of the process, describing its interactions with previous and subsequent steps, evaluating if its operating conditions are optimal and providing recommendations for improvement (in addition to technical and economic criteria, the standards of 'sustainable development' will also be used as evaluation benchmarks).
₹	CONTENT	 Lectures, practical class, visits of food plant, project. Topics covered: Thermal unit operations (evaporation-concentration, spray-drying, heat treatments). Mechanical processes for physical separation: sedimentation, decantation, centrifugation, filtration, cycloning, membrane separation, solid-liquid extraction. Drying processes: drying, lyophilisation, atomisation. Diffusion, mass transfer and energy transfer between phases (diffusion theory, mass transfer coefficients, film theory). Phase equilibrium.
	EVALUATION	■ Written reports on practicals, written exam

data analysis and applied statistics JWIA ISA to agrofood

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Pierre Vandendriessche	English

MAIN OBJECTIVES	To take into account the multiple backgrounds, this course is designed to improve basic and advanced knowledge of statistics and probabilities
SKILLS DEVELOPED	 Being able to master all relevant statistical tools related to statistical quality control, process control and R&D in Food Science.
CONTENT	Tutorial class essentially, interactive lecture, problems, real case studies Basic Statistics: tables, charts Numerical descriptive measures Basic probabilities (events, Bayes, conditional) Discrete distributions (Binomial, Poisson, Hypergeometric) Continuous Distributions (Normal, Fisher, Student) Sampling Confidence Intervals (mean, proportion) Hypothesis Testing Single and Multiple Sample tests (parametric and non parametric) ANOVA (one way, two ways, randomized block design) Post Hoc Tests (Tukey) PCA, CA, HAC, MCA
EVALUATION	Presentation of case study analyze in groups of 3 or 4 students. 50% written presentation (Power point) 50% oral presentation

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Caroline Choma	English (french in semester 2)

®	MAIN OBJECTIVES	Discoveries and uses of biotechnology and bioprocesses – agro-industry and agriculture applications. In this teaching unit, students will have a view on the complexity of bioprocesses: Microbial biomass production; Fermented foods production; Biomolecules used in food industries, food products and agriculture
	SKILLS DEVELOPED	 To comprehend the complexity of bioprocesses; To better grasp the opportunity to participate in the development and implementation of strategies and action plans for a sustainable food industry; To analyze and solve quality problems associated with fermented foods or compounds obtained thanks to the use of bioprocesses (from a scientific and technical point of view).
	Lectures/conferences; Visiting of production and yield of production	companies (Roquette, DSM, Lesaffre, etc); Tutorial work and/or Practical work (biomass on calculation)
	Introduction	■ bioprocesses and biotechnology definitions
€	Introduction Microorganisms potentialities

	Microorganisms potentialities Various uses, industrial applications Processes and equipment/	 bioprocesses and biotechnology definitions What are they? and their life dissection (nutrient requirements; biomass production & anabolism; growth phases) What characteristic/specificity of a microorganism is used and for what application or which final industrial product? (Primary and secondary metabolites; Enzymes).

agrofood professional project

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Caroline Kaczmarek	English or French

	MAIN OBJECTIVES	The student must be able to: define his/her professional project identify and illustrate his/her personal and technical skills understand the concepts of the charter of written work and write the presentation of the company part
	SKILLS DEVELOPED	 Design a CV (personal and technical skills) Definition of the professional project and of the internship research according to it Development of the communication skills (presentation, general communication, interviews) General understanding of the charter of written work General understanding of the basics of an internship report
\$	CONTENT	 Skills and jobs in the food sector CV and cover letter Networking (LinkedIn) Mock interviews Written report workshops
	EVALUATION	CV Written report

production management

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Pierre Vandendriessche	English

	MAIN OBJECTIVES Discover and understand the typical organization of a food production company (business processes, departments, jobs and missions) Discover and understand the various flows involved Reflect on team management skills	
	SKILLS DEVELOPED	 Discover and understand the key business processes involved in an industrial food production environment Acquire the fundamental vocabulary related to industrial food production and supply chain Understand the data required in how it is structured / managed Understand the physical, data and financial flows Discover the use of an ERP system Understand the junior team manager's legal framework IT skills: how to structure data and produce sensible KPIs Running supply chain processes in an ERP system Reflect on the knowledge and behavior of the junior team manager in a food factory Adapt to social context
\$	CONTENT	Lectures, tutorials, visit of food plant, serious game. Industrial organization Material handling Demand and supply planning Labor & HR Specific software: ERP (SAP) and data visualization (Tableau)
	EVALUATION	Exam, serious game results (ranking against other competing teams)

product formulation

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	6	Emmanuelle Martin	English

(A)	MAIN OBJECTIVES	Propose a methodology based on the benchmarking of a food product available on the market - to develop a prototype with physicochemical and sensory characteristics the closest as possible to the target.
		■ Design a food product.
		Determine the appropriate microbiological and physicochemical analyses.
	SKILLS DEVELOPED	Understand ingredients-ingredients and ingredients-process interactions.
		Carry out the sensory evaluation of a food product by using adapted methodology.
		■ Analyze the results, propose clear recommendations and communicate them.
		■ Project – group work. Use of laboratories (Microbiology, chemistry, sensory analysis).
		■ Tools to help in the formulation and design of products
\$	CONTENT	■ Project of bench marking of a food product
<u>v –</u>)		■ Rapid techniques of microbiological controls
		■ Sensory evaluation: discriminative techniques
	EVALUATION	■ Intermediate and final assessment

food tech project

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	6	Vincent Dumortier	English

	MAIN OBJECTIVES	Mobilize knowledge and skills in food science to resolve a concrete technical issue presented in a professional setting. The project will be presented in the form of a problem arising in an industrial context (either an exterior sponsor or at Junia ISA with a link to an external study).
	SKILLS DEVELOPED	Work in a team with colleagues and in collaboration with the school or partner firm and use project management tools.
		Produce results in a rigorous and professional manner.
		Group work - Learning by technical case study - A project is completed successfully by a group of 3-4 students, supervised by a permanent teacher. Five main topics on food could be proposed: Analytic - Method - Raw Materials or Ingredients - Microbiology or Sensory
		■ The overall work period for a project is approximately 150 hours linked with 12 full project days during the semester. As a general rule, every Tuesday for 8 weeks, plus one full week reserved especially for projects.
\$= \$=	CONTENT	After a session for presenting the projects and training in project management, the work is completed autonomously (conception of experiments) with technical supervision (pilot food plant or laboratory).
		 Bibliographical study/latest developments on the project; proposition of an action plan and a methodology for addressing the issue; Experiment design; Critical analysis of results, summary report of work done
		■ Examples of project: Limit of the Brix Method for the determination of dry material - Dosage of sugar by HPLC - Enzyomes and fruit juice - Reserve osmosis - Feasibility study of putting into kegs - Candying - Egg whites/ Meringue - Tomato sauce: effects of texturizers - Study of the Maillard reaction - Study on biofilms - Setting up a new sensory analysis test.
	EVALUATION	■ Presentation and report or other deliverable for the partner firm

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Emmanuelle Martin	English

		■ To have basis knowledge of ingredients to formulate food products.
		Acquire knowledge to understand food formulation
(A)	MAIN OBJECTIVES	Know functionalities and implementation of main ingredients and additives used in food industry
		■ Food regulation
	SKILLS DEVELOPED Know how to propose a list of ingredients in adequation with desired formula	
		Lectures by professionals and practicals on:
		• food formulation
\$ <u>=</u>	CONTENT	 study of main ingredients, additives and processing aid (functionality, implementation, storage and preservation)
v —		
		■ aromas
		aromasfood regulation

	EVALUATION	■ food regulation

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Lucile Gaberel	English

®	MAIN OBJECTIVES	 Acquire fundamental notions of nutrition. Understand the importance of nutrition in an agrifood company and its place in strategy, communication, new product development, etc. Know the regulations about food and nutrition labeling. Have an overview of nutrition issues and politics around the world.
	SKILLS DEVELOPED	 Calculation of a human food ration and of the nutritional values of a food product Nutritional audit approach Researches on official websites
\ };;;	CONTENT	 Fundamentals in nutrition: nutritional needs for different groups of population, balanced diet, link between nutrition and health Regulations about food and nutritional labeling Nutrition approach in food companies, nutritional audit methodology Nutrition situation and policies around the world Visit of Danone Research Center
	EVALUATION	Oral presentation 40%Written exam 60%
	1- Lecture	Nutrition basicsBalanced diet
	2- Lecture	Balanced dietPracticalFood ration calculation
	3- Lecture	Specific populations nutritional needsHealth issues related to nutrition
₩ PROGRAM	4 & 5- Lecture + practical	 Nutrition labeling Self-directed time Research for group project
	6 & 7 - Outing	■ Danone Research Center
	8- Lecture + practical	Nutrition in an agrifood companyNutritional audit approach
	9- Oral presentation	Group project
	10	■ Exam

sensory evaluation

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Laureen Simon	English

®	MAIN OBJECTIVES	 This course is dedicated to students interested in Quality, R&D and Marketing departments of food companies. Knowing the different categories of sensory tests, their methodology and their applications in food industry
	SKILLS DEVELOPED	 Conducting a sensory test from A-to-Z Analyzing and interpreting sensory data with statistical tools Reporting sensory results in a professional style
() :::	CONTENT	Sensory evaluation is a unique discipline, today integrated in the decision making of many food and non-food companies. It is used to study the consumers' preferences, to describe a market. The sensory characteristics of a product and/or its presentation need to be considered from its conception, and then followed during production to guarantee the quality and the success of the product. The knowledge of sensory properties is regarded as a major control key of the quality perceived by the consumers. Lectures, Practicals/Tutorials, Group project on: Fundamental principles of sensory evaluation Basics of sensory physiology Setting up of sensory evaluation: sensory lab, assessors, sample presentation Discriminative tests: triangular test, duo-trio, etc. Descriptive tests: QDA profile, alternative methods (Flash, CATA, tri, etc.) Consumer tests Preference mapping
	EVALUATION	Group written reportGroup oral presentationIndividual exam

packaging and eco design

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Emanuelle Martin	English

		Give an overview of the various packaging materials and their properties
	MAIN OBJECTIVES	Understand all the chain of the packaging of the expectations of the marketing to the logistics of associated distribution.
V		■ Eco-design: know how to propose the best possible compromise
		■ Co-design
	SKILLS DEVELOPED	Know how to determine the nature of packaging, understand their roles according to their characteristics, know the associated logistics and estimate their environmental performance
		Courses and conferences - to acquire the fundamental on packaging
		Sessions of codesign - to bring a practical answer to a problem packaging put by an industrialist
		Presentation and definition of the packaging and the market
		Raising sensitization to the analysis of the value on packaging materials
l Ç ⊃1	CONTENT	Functional analysis of packagings used in food-processing industry
\$ <u>;</u>	CONTENT	Evolution of materials, permeability and interactions food / materials
		■ The processes of packaging used in food industries
		Regulations on packagings food
		■ Chemistry of plastics
		■ Context Stakes and method of ecoconception(ecodesign) of packaging
		Study of project in sessions of codesign
	EVALUATION	■ Oral defense in groups

physical, chemical, and microbiological characterization of food

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	6	Vincent Dumortier	English

	MAIN OBJECTIVES	This option is intended for students interested in R $\&$ D services, Quality or Production in agro-food industries.
<u></u>		It is a technical approach to food science. Food products will be studied through three analytical domains:
KT5		■ Physico-chemical
		■ Rheology
		■ Microbiology
		Contribution to knowledge of food composition through physico-chemical analysis
		■ Technological characterization of food through rheological or colorimetric analysis
	SKILLS DEVELOPED	■ Microbiological characterization of foods
	SKILLS DEVELOTED	Improvement of the student technical skills through new technologies and procedures of chemical, and physical characterization of food
		Acquisition of a critical mind towards analytical methods, procedures and their results
		Lectures, practicals, visits
		Lectures, practicals, visitsBiochemical and nutritional analysis (fats, proteins, carbohydrates, dry matter, minerals, vitamins)
-0-		■ Biochemical and nutritional analysis (fats, proteins, carbohydrates, dry matter, minerals,
€	CONTENT	Biochemical and nutritional analysis (fats, proteins, carbohydrates, dry matter, minerals, vitamins)
₹ !!!	CONTENT	 Biochemical and nutritional analysis (fats, proteins, carbohydrates, dry matter, minerals, vitamins) Physical analysis (rheology of solid, liquid, colorimetry of food)

specialization: quality management JNIA ISA systems in the agrofood sector

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	30	Caroline Kaczmarek	English

The aim is to train futures engineers able to:	
 Manage quality in the agrofood sector (food safety, environment, industrial riby combining the quality of the products and the economic issues; 	sks)
■ To answer to an international demand.	
The specific objectives consist in giving to the students:	
MAIN OBJECTIVES An international vision of the food supply chain from farm to fork, its constraint and opportunities;	nints
The necessary tools through operational approaches to put in place and impart a management system able to answer to international standards and norms management systems, environmental management);	
The skills to develop an integrated management system dealing with food so food fraud, food defense, environmental risks, security	afety risks,
The ability to communicate and to manage different projects through an intercontext in multicultural teams;	rnational
SKILLS DEVELOPED The capacity to develop the right methodology and use scientific knowledges to s	olve problems;
■ The ability to manage several projects in a sustainable way;	
■ The ability to work while using the English language.	
Organization through 3 points:	
■ Fundamental: lectures, tutorials;	
■ Projects: co-elab project, case studies;	
■ Visits: testimonies, companies, conferences.	
There are 8 modules:	
■ Module 1 - Quality management in production	
■ Module 2 - Food safety Management systems	
■ Module 3 - Resource management and responsibility	
■ Module 4 - Environmental and risks management	
 Module 4 - Environmental and risks management Module 5 - Integrated management systems and quality strategy 	
■ Module 5 - Integrated management systems and quality strategy	
 Module 5 - Integrated management systems and quality strategy Module 6 - Monitoring tools

department of agricultural economics, marketing & management

master of science and engineering program

Junia ISA's Agricultural Economics, Marketing and Management program aims to give students:

- an international view of the issue of agricultural trade and finance,
 highlighting certain national and/or regional specificities
- the necessary tools to manage business development and communication
- the necessary tools to manage agricultural trade, from purchase and procurement to industrial marketing and consumer behavior
- a practical view of site management, thanks to lectures and seminars by experts in the field
- methods to manage projects within an international context, with multicultural staff.

introduction to finance

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Van Hong Vu	English

		Understand and master the technical skills to analyze financial statements.	
		Learn French accounting standards and how managerial decisions affect financial reports.	
MAIN OBJECTIVES	Be able to construct, read and analysis the three most common financial statement: the income statement, balance sheet and cash-flow statement.		
		■ Be able to make a cost accounting analysis.	
	CVII I C DEVELOPED	■ Be able to understand how firm decisions affect a financial report.	
	SKILLS DEVELOPED	■ Be able to analyze firm financial health.	
		Generality about accounting	
		■ The Balance sheet and Income Statement:	
~ ~		- How to construct them?	
 	CONTENT	- How to analyze them?	
		■ The Cash-flow statement: construction and analysis	
		Cost accounting analysis: from the raw material to the finished good, how much does it cost?	
	EVALUATION	■ Written exam and a firm financial analysis	

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	6	Xavier Alix	English

	MAIN OBJECTIVES	 Have a comprehensive vision of the different aspects of the export function in a business; Be ready to develop an export strategy; Be aware of consequences and risks of an export strategy for the business
	SKILLS DEVELOPED	Be able to assure the management of the export function in a food-processing company, an agricultural supplies business, or, more generally, any company that would like to develop an export business.
\$!!!	CONTENT	 Diagnosis and strategy (Study and choice of markets, prospecting, organization and sales offer) Tools and techniques (transportation of goods, customs, calculation of a sale price export, international sale contract) Financing and risk management (reassurance of payments, documentary credit, cover (blanket) of the foreign exchange risk)
	EVALUATION	 Individual written work (30%) Practical study in group (50%) Oral group presentation of their export project (20%)
	Session 1	■ Lecture: Introduction; Important Trade milestones; Recent evolution of international Trade; Regional Trade agreements; Why do companies expand overseas? Why is export complex? How to target a market (4h)
	Session 2	 Lecture: Marketing; Marketing research; Marketing planning; Marketing segmentation; Marketing mix; Promotion; Business planning; Some tools (SMART, SWOT, PESTEL); Marketing plan; Case study; Data collection (4h)
	Session 3 Lecture: Ensure the presence of products on the market; Entry strategies; Various to implant in the targeted country (licensing, foreign direct investment, etc.) (4h)	
	Session 4	 Lecture: Building commercial policy; Exporting; Product; Exporting cost, pricing and sale; promotion; Countertrade, International contracts (4h)
<u></u>	Session 5	■ Lecture: WTO and regulation of international trade; Dispute settlement; world events and their consequences on business: how to prevent issues and adapt the business (4h)
₩ PROGRAM	Session 6	 Lecture: Transport and logistics; Infrastructures; Terms of Trade = Incoterms, International ocean, air, land and multi-modal transportation; Packaging for export (4h)
	Session 7	 Lecture: International logistics security; Documentation and customs procedures; Custom clearance; Payment; Basic business finance; Finance for international Trade; Terms of payment (4h)
	Session 8	 Lecture: Currency of payment; Managing transaction risks; International commercial documents; International Insurance; Visit and comments of website on main international trade actors (International Chamber of Commerce, etc) (4h)
	Session 9	 Lecture: Using international logistics for competitive advantage; suppliers and support organization; exchange and questions about the full course; Preparation of the week-long project (4h)
	Week-long project	Group work: the students will be asked to prepare a full project of export of a product overseas, with the description of all steps, from the decision to export to the delivery of the products and their payment, and with costs impact (35h)

decision tools: statistics and market research

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Amar Djouak	English

®	MAIN OBJECTIVES	This unit aims to put knowledge acquired in the field of statistics and marketing at the service of a specified problem. The scope may apply to agriculture, agri-food, environment or landscape fields of study. This approach will enable students to put into practice the acquired knowledge to analyze and solve a given problem.
	SKILLS DEVELOPED	To carry out a quantitative survey, for example in the context of a market study, from planning to statistical analysis and results synthesis.
♦	CONTENT	 Quantitative surveys: methodology and tools Descriptive and inferential statistics Putting into practice acquired notions by carrying out a case study (survey)
	EVALUATION	■ Oral group exam

introduction to marketing

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	Julie Christiaen	English

	MAIN OBJECTIVES	To introduce students to strategic issues concerning international marketing, mains steps of the identification of a market, and marketing mix adaptation to an international and multicultural environment.
	SKILLS DEVELOPED	Based on the international environment context: To analyze a foreign market and identify opportunities and threats To recommend relevant marketing strategy for a company To understand, create/adapt a marketing policy to international markets To prepare a marketing plan and financial recommendations to be submitted to the management of a company or external financial investors To communicate and make a professional business presentation in a multicultural environment
		environment
♦ :::	CONTENT	 DISCOVER and LEARN Theoretical approach to international marketing issues: strategic marketing, research marketing and operational marketing, financial decisions PRACTISE Through a case study: multicultural marketing teams work on a product to be launched in a new country; based on a market study, give recommendations regarding marketing strategy, marketing policies and financial decisions.
	EVALUATION	Oral presentation on case study (80%)Written recommendation to convince external financial investors (20%)
	Session 1 & 2	■ Lecture: International marketing strategy (8h)
	Session 3	■ Lecture: Market study in an international context (4h)
	Session 4	Lecture: Marketing policies (4h)
	Session 5	■ Lecture: Financial issues (4h)
PROGRAM	Session 6, 7 & 8 Case study: launch and coaching / Market study, marketing strategy and market (12h)	
	Session 9	Case study: coaching / financial recommendations (4h)
	Evaluation session	Oral presentation (4h)

purchase and procurement

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Alain Millecamps	English

(A)	MAIN OBJECTIVES	Buying in the head of purchasing in retail or inside a major food supplier is not the same on a daily basis. This program integrates the different levers, constraints, methods and interactions of the purchasing process.		
		■ Manage the "7-step supply" general process.		
□ □ □ ○	SKILLS DEVELOPED	■ Purchasing negotiation skills.		
SKILLS DEVELOPED	 Common focused practices and key differentiated processes following markets. (Retail, Industries, small companies, importation, distribution channels) 			
		A business case study focused on purchases enable the students to implement a purchasing plan. In detail, the focus is done by different professionals:		
		a purchasing plan. In detail, the focus is done by different professionals:		
		The strategic dimension of the function The variables of the function		
0		The marketing of purchasing and segmentation Ctrotogy implementation		
()	CONTENT	Strategy implementation		
<u>v</u> -		Sourcing methods		
		■ RFI, RFQ, contracts		
		Negotiation skills		
		Supply chain		
		Supplier Relationship management		
		Sustainable purchasing		
	EVALUATION	■ Participation: 25%		

trade negotiation

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Alain Millecamps	English (french in another period of s2)

(A)	MAIN OBJECTIVES	To be able to negociate with professional buyers and to understand and plan the different steps of a structured selling appointement.
	SKILLS DEVELOPED	 Assume the sales function in the actual global market. Differentiate between the selling act and the negotiation act Manage the different steps of the selling process
():::	CONTENT	Theory, practice, presentations. The constraints of a commercial call in B to B The sales function in the actual global market. Differentiate between the selling act and the negotiation act as well as prospection and follow up The different steps of the selling process, meaning: - telephone skills - professional preparation - introducing yourself - understand the customer's concept - doing the pitch and deal with the objections - negotiate with the relevant major tools - close the sales and contractualize - follow up Understand the purchasing approach Key Account Management process
	EVALUATION	■ Continuous assessment

business development project

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	6	Alain Millecamps	English

®	MAIN OBJECTIVES	This module aims to provide complementary knowledge that will enable the students to build a business plan. This approach is useful to launch a product range, a new business unit or set up a company.
	SKILLS DEVELOPED	The students will be able to: • run a structured market survey • challenge a concept towards a B to C or B to B target with the relevant marketing tools, for instance questionnaires or insights • build a marketing plan • design a virtual company structure able to support the activity • implement the concept through an income statement • write a business plan
	CONTENT	 general marketing skills advanced marketing skills like market surveys and questionnaires commercial skills, forecasts general financial skills advanced finance concepts like cost per unit, income statement technical constraints business model and business plan
	EVALUATION	The integration of those concepts is implemented in a business case study, which is the final deliverable. Project report: 50%

digital business

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Marc-antoine D'Hulst	English

	MAIN OBJECTIVES	 Understand the digital world: changes and issues Gain knowledge of how E-commerce and Digital Marketing work (levers and tools) Perceive the importance of data, performance indicators and analysis tools Understand the evolution of the customer relationship
	SKILLS DEVELOPED	 Analysis of a digital and business strategy (tools, contents, UX Design and datas) Master stages of digital business and understand the particular features Successfully manage a targeted digital campaign Optimize the reference traffic flows and the online sales
	The digital world	■ Key figures, consumers behaviour, jobs and vocabulary
	On-line business	■ Trading practices, operating mode, tools and developments
CONTENT	Digital Marketing	 Strategies, issues, Inbound & Outbound Marketing, User experience (UX) Design, Social Networks and SMO (Social Media Optimization), content management, SEO (Search Engine Optimization) and SEA (Search Engine Advertising)
	Data	■ Data acquisition chain, Key Performance Indicators and reference traffic flows optimization
	Consumer service	■ New expectations, consumer supports and digital content, risks and benefits
	EVALUATION	 Online multiple choice or true/false quizzes on best practices Workshop and oral presentation on a digital strategy for launching an E-commerce website
EQ	PROGRAM	■ For this program, the objective is to alternate theoretical knowledge and practical highlights

b-to-b marketing

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Ulku Tarhan	English

Ö	PREREQUISITES	■ Fundamental aspects of marketing – Concepts, methods, tools knowledge
(A)	MAIN OBJECTIVES	■ To introduce and train students to specific characteristics of BtoB marketing.
	SKILLS DEVELOPED	■ To be able to figure out how to work through BtoB marketing issues, using relevant tools and methods.

financial analysis

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	6	Sophie Gozdziaszek	English

	MAIN OBJECTIVES	Analyze and understand the operation of a listed company		
SKILLS DEVELOPED		Understand IFRS consolidated financial statements and conduct a financial analysis of a listed company.		
CONTENT		 Understand consolidated financial statements Understand and analyze the IFRS financial information Conduct a group financial analysis and analyze the impact of strategic decisions on financial results Write a well-argued and well-balanced report on a listed company Discover the basis of company valuation 		
	EVALUATION	 Individual assessment: (30%) A final report (in pairs): (70%) Oral presentation (20%) Written report (50%) Choose a listed company and analyze their IFRS Consolidated Financial Statements. Prepare a report on this company which should contain: A strategic analysis and a financial analysis of the group 		

consumer behavior

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	Dr. Fatma Güneri	English

	MAIN OBJECTIVES	The aim of this course is to familiarize you with the fundamental concepts of consumer behaviour and the different methods and tools available in companies in order to facilitate the purchasing process.
(A)		As consumers are hyper-connected, volatile and demanding, marketing must constantly evolve by adopting new methods of analysis and practice to strengthen their customer relationship and offer a convincing shopping experience that must be repeated.
		Points of sale, distribution channels have multiplied and customer appeal must always be innovative to recruit new consumers.
		■ Discover the consumer trends and expectations of the 21st century consumer
		Understand the concepts of consumer behaviour
ΠЪ		■ Identify new experiences and cross-channel customer paths
	SKILLS DEVELOPED	 Deciphering the marketing challenges and strategies of supermarkets, optimizing the use of digital technology to sell more effectively
		To know the new types of consumers following technological developments (the effect of artificial intelligence)
		Attendance required at each session, which will be in two parts:
		■ Part 1 : The instructor's presentation
		■ Part 2 : The group exercise (to be graded by the instructor)
	Global informations	Students are expected to:
		■ complete assigned readings before each session
		arrive on time: delays will be marked as absences
		■ participate: courses will be very interactive
		■ Give a project to the students to lead
		 Course on consumer behaviour: definition of the consumer, the customer,
		the decision-making processes leading to the purchase
		■ Trend definition, consumer typology
æn.	DAY 1: Introduction,	■ Importance of profiles, lifestyles (INSEE, CREDOC, IPSOS, KANTAR)
\ <u>\</u>	definition, consumer research and lifestyles - trends	Customer knowledge: new tools to analyse consumer behaviour, needs and activities on the Internet
CONTENT		Focus on Food marketing: revalidation of achievements: market research - importance of the customer in B to C
		■ Marketing of sustainable development
		■ Project: identify all sites, institutions to be considered, reconstruct the trend tree
		How to establish a lasting relationship with brands: what is a brand, what is its function, its value, what is its interaction with the customer brand territory
		■ Importance of the logo, the slogan, its positioningimportance of creativity
	DAY 2: Companies and brands	■ Rebuild trust with your customers: needs for explanations, transparency and proximity

	Common modules, including both technical and business skills	 Business project in agribusiness sector: practise (3 weeks) Farm diagnosis: farm strategy, advices and project on the farm (2 weeks) Agriculture & society: Sustainable and smart agriculture around the world (conference management (1 Week) 	

General Information

Master of Science and Engineering Program

Junia ISEN is Junia's Graduate School of electronics and digital technology.

Interested students must have a background in related scientific disciplines. Junia ISEN places students at the crossroads of technology, its applications, and societal issues. Junia ISEN allows each student to reach their full potential by helping reveal their talent through tailored programmes, global-mindedness and interaction with the professional world.

Students pursuing a Master's degree choose one of three specialisations:

- Big Data,
- Embedded Electronics, or
- Software Engineering.

The courses below are common to all Junia ISEN Master programmes.

MASTER 1 - FALL SEMESTER	ECTS
Java 1	3
Technical Project S1	7
French as a Foreign Language	3

MASTER 1 - SPRING SEMESTER	ECTS

MASTER 1	Semester 1	3	M. Morelle	English

÷.	PREREQUISITES	■ Basic algorithms and data structures in the computer software
	LEARNING OUTCOMES	 Understand the aims of JAVA programming language Know how to carry out an application in JAVA. Be able to implement the basic notions of the object-oriented programming: inheritance, encapsulation and polymorphism.
₹ ;;;	COURSE DESCRIPTION	 General presentation of JAVA programming language Simple objects construction Composite objects construction Inheritance Exceptions Out/Input Threads Introduction to graphical applications development

technical project

L	.evel	Period	ECTS Credits	Teacher Coordinator	Language
MA	STER 1	Semester 1 & 2	7	JM Capron M. Morelle	English

	LEARNING OUTCOMES	 Undertake a study to respond to the need of a company, a laboratory, or a professor. The area of study is unique to each subject; the objective is to apply concepts studied in class and also to enhance knowledge by personal research within the confines of outlined projects. Apply project stages in group work. Be able to present the work in an academic defense. Ensure the project outline is given, and turn in a detailed report that allows for use and follow up of the product developed.
1	COURSE DESCRIPTION	To begin with, students will choose a subject from a list suggested by instructors. Subjects describe situations where companies would like solutions to a given problem. The areas addressed will cover one or several of the disciplines taught at the university. The work will be done in groups (of two or more), under the supervision of a teacher who will direct the work. Each group will have the freedom to organize themselves as they wish but must debrief the 'client' and/or supervisors on a regular basis. In this way, project stages taught in course will be applied in practice. A collaborative
		website will be used so that each group member, student or supervisor, will be informed of the real working rate of project advancement and may have access to the various working documents.
		For a majority of suggested subjects, the study will terminate with the production of a product (application or function).

three-month internship

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	10	E. Litton	English

	COURSE DESCRIPTION	The internship is for a minimum period of three months. It is to be made between the first and second year of Major cycle and gives rise to the allocation of 10 ECTS credits without grading.
\$= - -		This period is a technical skills application internship in a company or industry.
ŧΞ		The Board of Studies may permit an internship in a research laboratory on motivated request from the student.
		The internship is evaluated through a report and verification of skills acquired with the company.

innovation project

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1 & 2	9	D. Boulinguez	English

Ö	PREREQUISITES	None
	LEARNING OUTCOMES	At the end of this study the student is able to: analyse a complex system in the area of his scientific domain conduct a literature study on a well-defined problem and determine the state of the art in the matter propose a solution to a complex technical problem evaluate the proposed solution in terms of performance, fulfillment of the requirements, delay and cost
{ }∷:	COURSE DESCRIPTION	The case study's aim is to establish the feasability of a complex system from the specifications provided. The different activities are: establish the state of the art in the area from a litterature study determine the performances that could be expected and refine the specifications propose an appropriate solution in terms of performance, delay and costs evaluate in detail the proposed solution by means of modelling, simulation and in the need arises, the design of a prototype. Deliverable of this work are: litterature study and refined specifications (to be approved by the advisor) report on detailed feasability study oral defence of the study to a Jury The study is done by a small group of students (2 to 4 students)

final industrial internship

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	30	E. Litton	English

		The internship of six months is placed at the end of the study.		
		It must be done in a company, except for students following a research master programme.		
		In this internship the student will perform missions equivalent to those of an engineer.		
\$ =	COURSE DESCRIPTION	This internship is evaluated by a report, an oral presentation, and the verification of the acquisition of skills with the company.		
		Validation of the internship is mandatory for graduation, except for students who have completed a 3 month internship in a company and then a full year of studies abroad.		
		This internship gives rise to the allocation of 30 ECTS credits without grading		

big data

Master of Science and Engineering Program

Big Data describes sets of data being so voluminous and complex that traditional data-processing application software is no longer able to manage the information.

Big Data presents one of the greatest IT challenges of our era and many experts have made Big Data their R&D priority.

AIM

Digital marketing, mobility, health, environment...

JOB OPPORTUNITIES

Chief data officer, business intelligence manager, data scientist, data analyst, data miner, master data manager, data protection officer...

network & system base

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	D. Delannoy H. Benhabiles	English

Ġ	PREREQUISITES	■ To follow this module, the student must know the basics of local networks (Ethernet, IP, static IP routing, TCP-UDP, DHCP, DNS, usual web application protocols, mail,).
		Targeted skills: 32(322/323), 34(342/343), 43(431/432/433), 112(1122) This module is a first implementation of local networks and linux systems. It takes up the notions cited in the prerequisites in scenarios intended to master the protocols and to identify the interactions between them. New concepts concerning the use of virtualization of linux machines are discussed. The orientation is suitable for all engineering profiles in software development, big data, cyber security, connected objects domains.
	LEARNING OUTCOMES	At the end of the course, the student will: Know how to use a linux operating system in a virtualization environment Be able to configure the network interface of a machine on linux or Windows Know communication protocols and parameters Know how to present the mechanisms of communication Be able to define and implement experiments illustrating particular points of operation Be able to implement basic network equipment Know how to use a network traffic analysis tool Know how to reproduce and interpret the results of an experiment The "hands-on" approach requires the acquisition of technical and transversal skills such as autonomy in understanding and learning, communication and restitution.
\	COURSE DESCRIPTION	This module covers the following topics: The use of a virtualization environment such as VMware The functioning of the main network protocols The detailed analysis of protocols Ethernet, IP, TCP, UDP, ARP The implementation of IP routing and subnetting The DHCP Services configuration The network interface configuration The Service and application filtering The diagnosis of a malfunction with Wireshark

data report, communication and visualisation

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	F. Windal H. Benhabiles	English

Ö	PREREQUISITES	■ Bases in Probability & Statistics
		Target Skills: 34(342,343), 53(531,532), 54(541,542),55(551,552,553) 61(611,612,613), 62(621,622), 63(631,632,634,634), 110(1102) In the business around data, it is more than important to communicate, popularize the results and make the analysis aesthetic and synthetic for your customers and your contacts.
	LEARNING OUTCOMES	■ In this course, the objectives are several. We will first approach programming with the R language. Indeed, R is a language dedicated to the science of data. You will learn to deploy the environment to work with this language and to program functions and instructions from the most basic to the most complex.
		■ In a second step, we will approach the libraries which allow very beautiful graphics, curves, with ergonomic layouts, captivating colors which allow an efficient and dynamic reading of the results.
		In a third section, we will explore the bookstores to produce report type documents (pdf, word), presentation type, or web page type to communicate with customers.
		■ Programming with R language
	COURSE DESCRIPTION	Libraries for data visualization (ggplot2, dyplr, tidyverse)
* =		Shiny for dynamic web pages
		Rmarkdown and Rbook for report, presentation

advanced statistical analysis

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	F. Windal	English

, ,		■ Bases in Probability/statistics
Ö	PREREQUISITES	■ Data Report, Communication and VisualIsation (S1M1)
		Target Skills: 31(311,312,313), 32(321,322,323), 33(331,332,333), 34 (341,342,343), 35(351,352,353), 52(521), 53(531,532), 54(541,542), 55 (551,552,553) 61(611,612,613), 62(321,322), 63(631, 632,633,634), 110(1101,1102)
		The science of statistics is a methodological corpus which makes it possible to establish crucial and important information indicators in different fields, such as, for example, business, humanities and health, politics, etc.
		The objective of the course is:
	LEARNING OUTCOMES	To give you a sufficiently deep understanding of the methods so that you can recognize the problem of a method in a questioning of the user and to properly assess the scope of the results that you obtain.
		■ To expose you to a wide range of methods with great application potential.
		■ To allow you to understand, use and explain statistical tools.
		Each chapter of the course will tackle a theoretical aspect followed by practice with the treatment of problems in R language of real life (business, human science).
		For those who have not followed the Data Report, Communication and Visualization course, a document on the R language will be distributed to you and teacher support for the acquisition of the software and the first steps with R.
		Description of a digital series
		■ Estimate-Confidence Interval
		■ Comparison of two means
		Comparison of two variances
رڪا	COURCE DECORIDATION	■ 1-factor analysis of variance
\$ =	COURSE DESCRIPTION	Analysis of variance with 2 factors without repetitions
		■ Tests based on the Chi2 criterion
		Links between two quantitative variables
		■ Simple regression
		Multiple regression

artificial intelligence

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	N. Ihaddadene	English

÷.	PREREQUISITES	■ None
	LEARNING OUTCOMES	 Understand the application fields and basic concepts related to Artificial Intelligence (AI). Learn how to model a problem and solve it with an AI approach. Start using AI modeling, machine learning and development tools. Browse recent advances in AI.
\	COURSE DESCRIPTION	 Background, definitions and basic concepts. Fields of application (Natural language processing, machine vision, robotics,). Input concepts. Modeling and problem solving. Supervised learning. Unsupervised learning. Neural networks and Deep Learning.

quantum communication

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	2	I. Lefebvre, JF. Robillard	English

÷.	PREREQUISITES	This module is intended to be accessible to all and requires as a prerequisite only a knowledge of the concepts seen in the course of quantum mechanics
	LEARNING OUTCOMES	This module must allow: to better master the fundamental principles and phenomena of quantum mechanics such as the superposition of states or entanglement acquire a state-of-the-art vision of the use of these principles and their use in telecommunications and the exchange of quantum keys for cryptography
\$;;;	COURSE DESCRIPTION	 Notions (Polarized photon - Superposition - Measurement - Intricacy - Correlated states) Implementation problems (Decoherence - Noise) Equipment used (Laser - Bi-photon generator - Photon counter - Optical fiber - Beam Splitter) Applications (Network, Quantum Key Distribution) Teaching modalities

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	F. Windal H. Benhabiles	English

. <u>;</u> .	PREREQUISITES	Java programming
		Target Skills: 31(311,312,313), 32(321,322,323), 33(331,332,333), 34 (341,342,343), 35(351,352,353), 52(521), 53(531,532), 54(541,542), 55 (551,552,553) 61(611,612,613), 62(321,322), 63(631, 632,633,634),
	LEARNING OUTCOMES	Engineers and decision-makers are confronted daily with problems of increasing complexity, which arise in very diverse technical fields such as in operational research, the design of mechanical and robotic systems, image processing, Artificial intelligence, electronics, etc. These problems to be solved are often expressed in the form of "difficult optimization problems" where a cost function to be optimized is defined and constraint data to be respected, otherwise the solutions proposed will not be feasible.
		The objective of this course is to familiarize you with a group of methods, called "metaheuristics" whose ambition is to best solve the problems called «difficult optimization».
ھے		The simulated annealing methodEvolutionary algorithms
\$ \$ \$ \$ \$	COURSE DESCRIPTION	■ Artificial ants
		Research with taboos

advanced machine learning

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	F. Windal H. Benhabiles	English

÷.	PREREQUISITES	None
	LEARNING OUTCOMES	The objective of this course is to familiarize you with the very advanced concepts of Machine Learning. The main algorithms will be presented and illustrated in intuitive ways, with practical and concrete cases where we want to make predictions. In this course you will also: Explore the field of machine learning with its models, algorithms and data training Understand supervised and unsupervised machine learning algorithms. Use monolayer and multilayer neural networks to calculate outputs Discover the technological tools for understanding machine learning.
	COURSE DESCRIPTION	 Advanced neural networks Random forests Decision trees Support vector machines.

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	D. Delannoy	English

÷;	PREREQUISITES	To follow this module, the student must know the notions of databases (reading a Conceptual Data Model, SQL queries) and have implemented these notions.
	LEARNING OUTCOMES	Targeted skills: 32(321/323), 34(342/343), 43(431/432), 56(561/562), 63(634), 110(1102) This module addresses the notions of data modeling based on the MERISE method and allows to understand the whole chain from conception to implementation in a relational database. The orientation is suitable for all engineering profiles in software development, big data, connected objects, engineer of business domains. At the end of the course, the student will: Know the concept of Information System data modeling Be able to model the data of a Small Information System Know how to read a conceptual data model and transform it into tables Know the process of creating a database under PostgresSQL Know how to insert data into a database and select them according to different criteria Know how to select data in a database according to different criteria
\$ 111	COURSE DESCRIPTION	This module covers the following topics: The role of modeling The relational principle of organization of information The presentation of the MERISE method The conceptual, logical and physical modeling The implementation of relational databases The principles of a Database Management System (DBMS) The description language of the database (SQL) The data manipulation language (SQL)

quantum computing

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	2	G. Chênevert, JF. Robillard	English

÷.	PREREQUISITES	This opening module is intended to be widely accessible to all and has no specific prerequisites apart from a general mastery of the useful concepts of the common core of the third year (quantum mechanics, probability, digital electronics, programming).
	LEARNING OUTCOMES	Target Skills: 34 (342), 101 (1011), 144 (1441), 146 (1461), 62 (622) To allow the student to acquire a factual and critical vision of the state of the art and the material and software perspectives related to the manipulation of quantum information. Master the foundations and put into practice simple algorithms in simulation or on real architecture (IBM Q).
	COURSE DESCRIPTION	 Quantum information: states and measurement Physical modalities of the qubit Logic gates Universal quantum computer Quantum simulation Main algorithms: Grover, Shor, Programming and simulation

cloud computing and architecture JNIA ISEN

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	3	F. Windal, D. Delannoy	English

` <u>`</u>		Java Courses (M1, semester 1)
<u>,</u>	PREREQUISITES	■ Network & Sys base (M1, semester 1)
		Data bases (CSI3, CIR3, semester 2)
		Target skills: 34(342,343), 41(412, 413,414), 42(422), 53(531,532), 54(541,542), 61(611,612,613), 62(621,622), 63(632,634)
		Cloud Computing
		The objective of this part of the course is to introduce the fundamental concepts of Google Cloud for a company. This platform includes various cloud services for computing, storage, networking, Big Data, machine learning, Internet of things, security, cloud management and application development that are directly launched on Google's servers.
	LEARNING OUTCOMES	Architecture
		The objective of this part of the course is to understand the concept behind the term "Big data", from a perspective:
		Architectural: resource organization, servers for performance optimization
		Technological: the software suite deployed
		Business: understanding the client's needs for the implementation of decision support tools
		Cloud Computing
		 Introduction of the fundamental concepts of cloud computing, technical aspects (data center architecture, non-relational databases) and economic aspects (service and billing)
		Development & deployment of a web application on the Goolge Cloud platform - PaaS service
r C		Big data Architecture
ξΞ	COURSE DESCRIPTION	Part 1: Deploying a Big Data Architecture
		Understand the notions of performance in the deployment of a Big Data architecture
		Acquire knowledge about data storage solutions
		Discern the differences between databases (NoSQL, Elastic, Oracle, MongoDB)
		Understand the importance of file systems (HDFS) in a Big Data architecture
		Example of the implementation of the "Crédit Agricole" datalake

hadoop and spark ecosystem

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	3	F. Windal, H. Behabiles	English

Ö	PREREQUISITES	Java, Cloud Computing and Big Data Architecture
	LEARNING OUTCOMES	Targeted skills: 33(331,332,333) 34(341,342,343), 35(351,352,353) For more than a decade now, companies have been confronted with new types of data, "semi structured", "unstructured" and "big data". The question of storage, power and speed of The processing of this new data is at the heart of the problems that companies must face. We are also witnessing a new architecture to organize this big data (data lake) and new technologies to simplify processing. The objective of the course is to introduce you to specific big data technologies like the Hadoop and Spark frameworks. Hadoop is a technology that enables distributed storage and processing of data. Spark is a technology that has the specificity of processing distributed data very quickly, almost immediately.
()	COURSE DESCRIPTION	Hadoop: Introduction to the framework Primary components Query language and connection to HDFS Distributed processing Spark: Introduction to the framework Stream joins Tolerance for faults The différents APIs.

it risk and management

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 2	3	D. Delannoy	English

Ö	PREREQUISITES	None
	LEARNING OUTCOMES	Targeted skills: 31(311/312/313), 32(321/322/323), 33(331/332/333), 56(561/562), 71(711), 110(1102) Risk management, which is taken into account in the development of the strategy and in all activities, is designed to identify events that may affect the functioning and therefore the viability of a company. It is designed to ensure the integrity of the information system and provide assurance that the cost must remain reasonable in relation to the issues. In connection with the business process management and IT risk management, this module provides guidance for mapping an Information System and defining action plans to enable it to render the expected services. The orientation is suitable for the engineering profiles of the areas of software development, big data, cyber security and connected objects, part of project management allows to integrate managerial profiles. At the end of the course, the student will: Understand the challenges of an information system Be able to identify the processes implemented Know how to follow a method of risk analysis Be able to identify, analyze and classify risks Know how to design a business recovery plan The case-of-use approach requires the acquisition of transversal skills such as taking into
₹ ==	COURSE DESCRIPTION	account a need, analyzing and proposing solutions, project management, group work, communication and restitution. Based on the "experience", "concrete cases" of business problems are developed in favor of a controlled management of business processes. These cases will illustrate the necessary steps in the MOA (project owner or contractor for whom the work is being carried out) and the MOE (project management or technical integration).

secured network architecture

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	3	F. Windal, H. Behabiles	English

÷	PREREQUISITES	To follow this module, the student must know the basic notions of local networks (Ethernet, IP, static routing, TCP-UDP, DHCP, DNS, common web application protocols, know how to use the linux commands related to the networks (ifconfig, route,) and the analysis tools (Wireshark). Reference: "network and system base module" M1 Junia ISEN
	LEARNING OUTCOMES	Targeted skills: 34(342/343), 43(431/432/433), 110(1102) This module provides a security focus of local networks and e-mail exchanges. It allows to implement these notions in the context of an enterprise network architecture. Orientation is suitable for engineering profiles in the big data and cyber security domains. At the end of the course, the student will know: How to design a secure network architecture How to implement mail management and infrastructure security applications Communication protocols How to evaluate the reliability of a configuration This module requires the acquisition of technical and transversal skills such as solution proposals, group work, communication and restitution.
\	COURSE DESCRIPTION	This module covers the following topics: The process of the exchange protocols by mail The identification and understanding of the attack mechanisms The role of the various components needed to secure a network The writing of a technical implementation and a recipe document The e-mail filtering (fishing,) The rules for securing a network, firewalling The design of a secure architecture and implementation of components The appliance configuration and testing

urbanization of it services

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	2	D. Delannoy	English

. <u>†.</u>	PREREQUISITES	None
	LEARNING OUTCOMES	Targeted skills: 31(311/312/313), 32(321/322/323), 33(331/332/333), 56(561/562), 71(711), 110(1102) In connection with technical and management, this module allows to understand the stakes and to master the deployment of the new information technologies. The agility that determines responsiveness to evolutions applies not only to software development, but also to the way in which the businesses and functions of the company rely on a harmonious set of resources - hardware, software, personnel, data and Procedures. The construction of an information system can no longer be freed from urbanization without compromising its ability to integrate new needs as a city could fade due to the lack of adequate infrastructures. The aim is to provide a complementary managerial dimension to the technical training required for architectural missions. The orientation is suitable for the engineering profiles of the areas of software development, big data, cyber security and connected objects, part of project management allows to integrate managerial profiles. At the end of the course, the student will: Understand the challenges of an information system Be able to identify the architecture of an information system (from hardware to applications Know how to follow a method of analysis of the computer heritage Be able to identify, analyze and classify the axes of improvement of an information system Know how to design an evolution plan Know how to follow urbanization methods and good practices
()	COURSE DESCRIPTION	Such as urbanization of human habitat (organization of cities, territory), its concepts have been taken up in computer science to model and formalize the engineering of Information Systems (IS). Urban planning thus defines rules and a coherent, stable and modular framework, to which the various stakeholders refer for any investment and evolution decision relating to the Information System. An introduction to the use of "best practices" ITIL (Information Technology Infrastructure Library) presents the methods and tools that today are indispensable for improving the management of IT services. It brings together the means to structure and improve the efficiency, performance and costs of these services. The adoption of these good practices ensures that customers and suppliers (internal and external) have a service that meets internationally established quality criteria. This module covers the following topics: The role and the stakes of an information system The foundations and principles of urbanization The strategic changes in the company The market opportunities The role of the players in the information system The mapping tools and metamodel representation The definition of the different missions of urbanization

embedded electronics

Master of Science and Engineering Program

Embedded Systems (ES) manage precise tasks in complete autonomy and in real time, providing solutions in a variety of economic sectors: energy, health, transport... ES covers a wide range of skills in the fields of energy consumption, integration, data processing, and communications.

This professional profile trains engineers who master the material aspects (electronics) and software implications (embedded systems or mobile applications) of high-tech systems that improve our everyday lives.

- AIM: Aeronautics, automobile...
- JOB OPPORTUNITIES: Embedded systems designer, communication electronics technician, integrator, tester, systems project leader, systems integrator, embedded applications architect...

advanced digital signal processing JNIA ISEN

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	C. Krzeminski D. Boulinguez	English

: <u>;</u> ;	PREREQUISITES	Due to the limited number of lectures, required prior knowledge concern the lectures in signal processing of previous academic year (CSI3). In particular, it is necessary to be have a deep knowledge of: Fourier analysis Sampling and Nyquist Frequency Convolution Introduction to Time Discrete Transform
	LEARNING OUTCOMES	The main objective of this course is to presents the fundamental signal processing principles necessary for the design of digital systems used in many domains of application (electronics, telecommunication).
COURSE DESCRIPTION		Course contents in the digital signal processing: Reminder: Digital signal: sampling and quantization and Applications Advanced discrete Fourier transform and applications (FFT,DCT) Digital Filtering: introduction, IRF filter, IIR filter, bilinear transform Training Exam: Implement of a digital filter in a DSP

analog circuit design

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	B. Stefanelli	English

Ö	PREREQUISITES	Master the basics of circuit analysis (Ohm's law, Kirchoff's laws, Thevenin-Norton, superposition theorem, Bode diagram) Master the concepts involved in operational amplifiers circuits (biasing, small signal, linearity.).
	LEARNING OUTCOMES	 Determine the characteristics of linear circuits based on transistors and/or operational amplifiers, Design linear circuits based on transistors and/or operational amplifiers, given a set of specifications, Set-up simulations to verify and imrove characteristics.
\$	COURSE DESCRIPTION	 Semiconductor devices (diodes, transistors), Linear operation of semiconductors (mono and multi-stage amplifiers, differential pairs, current mirrors), Power stages, Frequency response.

digital programmable circuits: fpga & vhdl

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	B. Stefanelli	English

Ö	PREREQUISITES	 Master analysis and synthesis tools for combinational circuits, Master the design flow of a simple finite-state machine. This corresponds to a standard digital electronics course like "Electronique Numérique" (1314-ISEN-L3S1-CSI3-ElecNum).
	LEARNING OUTCOMES	Targeted skills: 32 (323), 34 (342/343), 42 (422), 1110 (11102) Synthesize a digital function on FPGA, Master VHDL basics.
\$= \$= \$=	COURSE DESCRIPTION	Introduction to the architecture of digital programmable circuits (FPGA),Introduction to VHDL.

wireless technologies and applications

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	JM. Capron JF. Lampin	English

÷.	PREREQUISITES	None
	LEARNING OUTCOMES	The objective of this lecture is to introduce the fundamentals of wireless communications, and their implementation in broadly used applications. It explains the technologies and architectures involved in wireless transmission of analog and digital information, focusing on the latter case.
		The bases of electromagnetism and transmission lines are developped, as a prerequisite to antenna analysis.
\	COURSE DESCRIPTION	 The course includes two complementary parts: The former deals with the fundamentals explaining the propagation of electrical signals along transmission lines. By extension to electromagnetism, this leads to antennas theory, whose operation and main characteristics (gain, radiation,) are developed. Link budget is finally studied, which shows the relation between emitted and received powers in case of a wireless transmission. The second part deals with applications: it shows how the above principles can be used to build a RF system, such as cellular phone communications. The following topics are studied:
		 multiple access techniques to optimise the use of radio channels, influence of noise and linearity on RF system performances, IQ modulation for digital wireless communications, basic functions in the architecture of a RF transmitter or receiver, frequency synthesizer operation.

hands-on 32-bit arm microcontrollers

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	2	B. Stefanelli	English

	1	
ŢŢ.	PREREQUISITES	 Master the basics of microcontroler architecture (ALU, IO's, memory) and assembly language programming.
. 	PREREQUISITES	 This corresponds to a standard digital electronics course like "Electronique Numérique" (1314-ISEN-L3S1-CSI3-ElecNum).
		Targeted skills: 32 (323), 34 (342/343), 42 (422), 110(1101/1102), 1110(11104)
		Acquire the basics of ARM architecture,
	LEARNING OUTCOMES	 Acquire a deeper knowledge of advanced microcontrolers hardware implementing ARM Cortex-M4 core,
		Acquire the basics of inter-circuits and inter-systems data links.
		■ The ARM concept, STM32F446 architecture,
		The clock tree and PLLs,
		Basic I/Os,
~~		The interrupts,

		Low power modes,
		Direct memory access,
		CAN bus basics,
		programming in C

power electronics

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	JM. Capron	English

÷;	PREREQUISITES	Reliable electricity bases (voltage and current laws) and electronics fundamentals (passive and active components)
	LEARNING OUTCOMES	This lecture explains the fundamentals of switch-mode electronics systems when power and efficiency are a relevant issue. The principles given here can be applied to any power electronics application, but focus is given to switch-mode power supplies and DC-DC converters, since they are widely used in many equipments.
\	COURSE DESCRIPTION	 Passive components: technology and applications of capacitors and inductors Basic active power components: diodes and transistors (bipolar, MOSFETs) Comparison between linear and switch-mode electronics DC-DC converters with or without transformers Power Factor Correction Layout guidelines Introduction to ElectroMagnetic Compatibility.

microwave circuits

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	B. Legrand	English

	PREREQUISITES	The knowledege of the basics of the transmission lines theory in sinusoidal regime is required: characteristic impedance of a transmission line, wave velocity forward and reflected waves, reflection coefficient, standing wave ratio voltage, current and impedance on a transmission line SLUG, STUB Impedance and reflection coefficient relationship on the Smith chart
	LEARNING OUTCOMES	These prerequisites can be found in a lecture like: Wireless Technology and applications (0910-ISEN- M1P1-ST-MB-502) The goals of the lecture is to introduce the concepts, the techniques and the tools to design and realize electronic circuits at microwave frequencies such as amplifiers. In particular, the lecture explains the techniques of impedance matching between circuit stages. A second part of the course is focused on the concept of the S parameters that characterize electronic devices at microwave frequencies.
\	COURSE DESCRIPTION	 Smith chart Impedance matching networks using lumped elements and distributed elements Microstrip lines and circuit board design S parameters concept Microwave amplifier design: gain, stability, noise CAD (ADS software).

digital microelectronic circuits

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	E. Dubois	English

÷.	PREREQUISITES	None
		At the end of this class unit, a student must be able to:
		 Calculate the current-voltage characteristics of diodes, bipolar transistors and metal-oxidesemiconductor (MOS) transistors
		■ Properly explain the mechanisms of charge transport in the above mentioned devices
	LEARNING OUTCOMES	Derive the voltage transfer characteristic (VTC) of a basic bipolar inverter stage
		Derive the voltage transfer characteristic (VTC) of elementary CMOS circuits
		Implement and properly design simple combinational logic circuits
		Explain the operation of clocked circuits
		Extract a circuit schematic from a circuit layout.
	Chap. 1	 Properties of digital circuits Definitions, voltage transfer characteristic (VTC), noise margin
	Chap. 2	 Elementary digital bipolar circuits -The bipolar inverter stage in static regime, Analysis of different operating modes, The saturation regime and its numerical treatment, Calculation of the VTC
	Chap. 3	■ The Metal-Oxide-Semiconductor (MOS) Transistor: Introduction
(≙)	Chap. 4	■ The MOS capacitance: The ideal flatband condition, Different operating regimes, Calculation of the threshold voltage, The MOS capacitance
CONTENT	Chap. 5	■ The MOS Transistor: Structure, Current-voltage model (Memmelinck diagram), Different types of MOS transistors, Dynamic model, Elements of advanced MOS modeling
	Chap. 6	Elementary MOS Circuits: The MOS inverter, Inverter with passive resistor load, CMOS inverter, Gate delay, fan-in, fan-out, The CMOS switch
	Chap. 7	 Combinational circuits: Implementation & device sizing, Power consumption, delays and other issues
	Chap. 8	Clocked circuits: Latches & flip-flops, Dynamic logic
	Chap. 9	Process & layout: CMOS process, Layout: devices and parasitics, Interconnections, ESD protection.

audio signal processing

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 2	2	A. Pate	English

	1	
·		■ Signal and image analysis (3rd year)
承	PREREQUISITES	■ Basics of physics (waves and acoustics)
		■ Scientific computing (e.g. Python or Matlab)
		Targeted skills: 31 (311/313), 32 (321/322/323), 41 (411/413), 111 (1111), 146 (1461), 56 (561/562)
		 Get familiar with digital signal processing and filtering through real-life applications in the audio domain (speech and music)
	LEARNING OUTCOMES	Know how to describe and analyze an audio signal in the time, spectral, and time-frequency domains
		Know and implement classical audio analysis methods
		As a group, apply and organize acquired knowledge to analyze and understand state-of-the-art methods.
		 Basics of acoustics (propagation, atténuation, absorption, reflection, transmission, intensity, sound level, radiation, impulse response, reverberation)
•		Time (onset, energy, zero-crossing) and frequency (fundamental frequency, spectral centroid,) signal descriptors
\$	COURSE DESCRIPTION	 Detection of fundamental frequency and onset (methods in the time domain, frequency domain, as well as time-frequency domain)
		Speech modeling and coding (source-filter, LPC, cepstrum)
		■ Time-frequency analysis (STFT, filterbanks)
		Introduction to sound synthesis, denoising, audio coding, audio compression.

advanced electronics

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	3	JM. Capron	English

Ö	PREREQUISITES	Master analysis and synthesis tools for analog circuits. This corresponds to a standard electronics course like "Electronique Analogique & Numérique" (0910-ISEN-L3S1-CSI3-ElecAna&Num). A basic knowledge of transistor-level circuit analysis is required, as found in the course "Analog circuits design" (0910-ISEN-M1P1-MSNN-MF0-CCI:fonctionsdeb).
	LEARNING OUTCOMES	 Targeted skills: 31 (311), 32 (321), 42 (422), 56 (562) To gain the advanced knowledge that any engineer in electronics should have. To be able to understand the basic operation of the main building blocks used in telecommunication systems. To understand the design flow of digital systems, covering as well the methodology and the ressources design(memory, bus, CPU). The main part of this class deals with analog electronics (for typically 80%). The remaining part is related to digital electronics.
\$\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	COURSE DESCRIPTION	 Oscillators, Phase-Lock Loops, Direct Digital Synthesis, Digital systems architecture,

mixed-signal integrated circuits for audio applications

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	3	D. Delannoy	English

		■ fundamentals of digital signal processing
Ö	PREREQUISITES	basics of analog circuit design. Knowledge of FPGA design and VHDL is useful but is not mandatory.
		understanding of fundamental notions such as noise and non-linear distortion
		At the end of this course students:
		understand principles of high resolution data conversion
	LEADNING OUTCOMES	understand requirements in terms of noise and distortion for audio processing
	LEARNING OUTCOMES	understand circuit techniques used for analog processing at audio frequencies
		master design of digital signal processing architectures for data conversion
		master design and simulation tools for digital circuits and mixed-signal systems.
		The course is designed to allow students to gain pratical experience in circuit and system design as well as theoretical insight into principles of data-conversion and signal processing systems.
	COURSE DESCRIPTION	The course extensively relies on practical labs to illustrate theoretical aspects with focus on audio applications.
		Course content is structured around three major topics:
\$\frac{1}{2}		Delta-Sigma Analog-Digital Converters In this part, fundamental theory of data converters is recalled. The focus is then on the delta-sigma type analog-to-digital. The theory is supported by simulation exercises with MATLAB. A complete data converter architecture is implemented with programmable analog and digital circuits.
		Digital-to-Analog conversion This part is covered by a half day practical exercise aiming at the implementation of a delta-sigma digital-to-analog converter in a Field Programmable Gate Array (FPGA).
		Switched amplifiers for audio applications A half-day lecture introduces the design of switchedmode audio amplifiers in Integrated circuits (ICs), i.ex. for applications such as portable audio or wireless communication terminals. Another half-day is spent on the design and measurement of such an amplifier implemented by means of programmable circuits.

high frequency electronics

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	3	JM. Capron	English

. <u>÷</u> .	PREREQUISITES	None
	LEARNING OUTCOMES	Targeted skills: 34 (343), 146 (1461) This lecture presents which technics are involved to implement high-frequency electronics applications, covering wireless communications. It is illustrated by practical exemples which can be encountered in everyday life, for instance Radio-Frequency Identification (RFID) or Near-Field Communications (NFC)
{}	COURSE DESCRIPTION	 Presentation and explanation of radio techniques for wireless communications (with practical demonstrations). RFID and NFC technics. Microwave electronics. Specification and applications of microwave electronics. Transmission lines. Power transmission and S-parameters. Microwave devices and associated functions.

real-time computing for embedded systems

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	3	D. Delannoy	English

÷;	PREREQUISITES	■ C programming and processors architecture.
	LEARNING OUTCOMES	Implementing a real-time embedded application requires a good knowledge of basic mecanisms such as task scheduling, memory management, or drivers loading. The objective of this training is to address these topics through practical labs, based on Raspberry Pi boards.
\$== **=	COURSE DESCRIPTION	 Introduction to embedded systems features. Building of a real-time kernel. Booting mechanism. Code development and debugging. Tasks scheduling and synchronisation. Real-time systems performances and limitations.

automotive electronics

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	2	JM. Capron	English

Ö	PREREQUISITES	None
	LEARNING OUTCOMES	Targeted skills: 52 (521), 71 (712, 713), 83 (831), 126 (1261, 1262), 56 (561) The objective of the course is to give a good knowledge of the automotive domain through the applications of electronics in current and future vehicles. In addition, specific issues such as quality, cost and reliability are also introduced. The trends and the involved technologies are studied.
₹ ;;;	COURSE DESCRIPTION	 Electric and electronics applications in automotive Hybrid vehicles Data multiplexing (CAN network, etc) Wireless control Automotive radar Driving automation Optical and electronics components for automotive Reliability and test Project management / Quality

software engineering

Master of Science and Engineering Program

Software and applications development encompasses all elements of the design chain of high-tech products: in embedded systems middleware and infrastructures. The quantity of data to be processed is ever larger, and methods of collection, storage and analysis are in constant progression.

This professional profile trains engineers specialized in cutting-edge technologies, such as Big Data and Cloud Computing.

- AIM: Mobile applications, Cloud, e-commerce, Web 3.0...
- JOB OPPORTUNITIES: Applications designer, website developer, IT solutions integrator, test engineer, systems and network architect, IT project leader, DSI (Director of Information Systems), facilities engineer, network operations engineer, web architect, multimedia developer...

network & system base

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	D. Delannoy H. Benhabiles	English

Ö	PREREQUISITES	To follow this module, the student must know the basics of local networks (Ethernet, IP, static IP routing, TCP-UDP, DHCP, DNS, usual web application protocols, mail,).
	LEARNING OUTCOMES	Targeted skills: 32(322/323), 34(342/343), 43(431/432/433), 112(1122) This module is a first implementation of local networks and linux systems. It takes up the notions cited in the prerequisites in scenarios intended to master the protocols and to identify the interactions between them. New concepts concerning the use of virtualization of linux machines are discussed. The orientation is suitable for all engineering profiles in software development, big data, cyber security, connected objects domains. At the end of the course, the student will: Know how to use a linux operating system in a virtualization environment Be able to configure the network interface of a machine on linux or Windows Know communication protocols and parameters Know how to present the mechanisms of communication Be able to define and implement experiments illustrating particular points of operation Be able to implement basic network equipment Know how to use a network traffic analysis tool Know how to reproduce and interpret the results of an experiment The "hands-on" approach requires the acquisition of technical and transversal skills such as autonomy in understanding and learning, communication and restitution.
{ };;;	COURSE DESCRIPTION	This module covers the following topics: The use of a virtualization environment such as VMware The functioning of the main network protocols The detailed analysis of protocols Ethernet, IP, TCP, UDP, ARP The implementation of IP routing and subnetting The DHCP Services configuration The network interface configuration The Service and application filtering The diagnosis of a malfunction with Wireshark

operating systems

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	D. Delannoy	English

Ď.	PREREQUISITES	To follow this module, the student must know the basic notions of local networks (Ethernet, IP, static routing, TCP-UDP, DHCP, DNS, usual web application protocols, Know how to use some basic linux commands.
•••		Reference : "network and system base module" M1 Junia ISEN
		Targeted skills: 34(342/343), 43(431/432/433), 112(1122)
		This module addresses concepts related to operating system concepts and virtualization. The orientation is suitable for all engineering profiles in big data, cyber security domains.
		At the end of the course, the student will:
□ A		Know the role and operation of an operating system, notions of file system, virtual memory, process, scheduleur.
	LEARNING OUTCOMES	■ Be able to implement mechanisms of synchronization of the processes (semaphores)
		Know how to use bass controls of a linux operating system
		Understand the interactions of an operating system with networks
		Understand the Issues and Principles of Operating System Virtualization
		The "simulation" approach requires the acquisition of technical and transversal skills such as autonomy in understanding and restitution
		This module covers the following topics:
		■ The operation of a processor and a standard computer architecture
		■ The operation of the EXT2 file system
~ ^5		■ The rights and security on Linux management
(\$)= 	COURSE DESCRIPTION	■ The memory management (Virtual memory, paging, swaping)
		■ The shared storage (NAS, SAN)
		■ The process management (Scheduler, Priorities)
		■ The management of sharing and synchronization of resources (Semaphore, State variables)
		■ The new Virtualization Models (NSX)

web technologies

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	D. Delannoy	English

Ö	PREREQUISITES	To follow this module, the student must know the basics of algorithm, procedural programming and data base concepts.
	LEARNING OUTCOMES	Targeted skills: 34(342/343), 43(431/432/433), 63(634), 110(1102) This module is an illustration of the approach and use of web application development tools. The orientation is suitable for all engineering profiles domains software development, big data, cyber security, connected objects, engineer of business domains. At the end of the course, the student will: Know the basics of Web Programming Know the basics of php, html and css languages. Know the difference and the usefulness of the different languages. Be able to set up a local php server. Be able to develop a basic website. Be able to integrate a database with a website. Be aware of good development practices.
\	COURSE DESCRIPTION	This module covers the following topics: Structure of an html page Using php primitives Architecture of a php application Implementation of CSS style sheets Use of a database for a website Use of object-oriented language in php Use of javascript

artificial intelligence

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	N. Ihaddadene	English

÷.	PREREQUISITES	None
	LEARNING OUTCOMES	 Understand the application fields and basic concepts related to Artificial Intelligence (AI). Learn how to model a problem and solve it with an AI approach. Start using AI modeling, machine learning and development tools. Browse recent advances in AI.
()	COURSE DESCRIPTION	 Background, definitions and basic concepts. Fields of application (Natural language processing, machine vision, robotics,). Input concepts. Modeling and problem solving. Supervised learning. Unsupervised learning. Neural networks and Deep Learning.

quantum communication

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	2	I. Lefebvre JF. Robillard	English

÷.	PREREQUISITES	This module is intended to be accessible to all and requires as a prerequisite only a knowledge of the concepts seen in the course of quantum mechanics
	LEARNING OUTCOMES	This module must allow: to better master the fundamental principles and phenomena of quantum mechanics such as the superposition of states or entanglement acquire a state-of-the-art vision of the use of these principles and their use in telecommunications and the exchange of quantum keys for cryptography
\$\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	COURSE DESCRIPTION	 Notions (Polarized photon - Superposition - Measurement - Intricacy - Correlated states) Implementation problems (Decoherence - Noise) Equipment used (Laser - Bi-photon generator - Photon counter - Optical fiber - Beam Splitter) Applications (Network, Quantum Key Distribution) Teaching modalities

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	M. Morelle	English

÷:	PREREQUISITES	To follow this module, the student must know the concepts of object-oriented programming and master Java programming (class, inheritance, composition, exceptions). Reference: "Java 1" M1 Junia ISEN.
	LEARNING OUTCOMES	Targeted skills: 31(311/312/313), 34(342/343), 43(431/432/433), 63(634), 110(1102) This module is a deepening of Java programming to create dynamic web applications. It does not deal with web programming. The orientation is suitable for engineering profiles in the software development domain. At the end of the course, the student will: Know the concepts of object-oriented programming Be able to develop an interactive Java application Know how to interconnect a Java application with a relational database Know how to organize a Java development project with the Maven tool Be able to implement unit tests to ensure software quality
()	COURSE DESCRIPTION	This module covers the following topics: The development of interfaces and polymorphism in Java The mechanisms for accessing files The mechanisms for managing the flow of incoming and outgoing information (NIO) The testing tools (JUnit and AssertJ) and handling of the debug features of the IDE The dependency management and scaffolding of a Java project with Maven The notions of generic classes and methods The use of collections The mechanisms for accessing databases with JDBC The development of graphical interfaces in Java (JavaFX) The new syntaxes and functional approaches with Lambdas and Java 8 Streams

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 1	3	D. Delannoy	French

÷;	PREREQUISITES	To follow this module, the student must know the concepts of objects (construction of simple objects, construction of composite objects, inheritance, exceptions, inputs / outputs, threads,) and have implemented these notions in JAVA. Reference: "JAVA 1 module" M1 ISEN Lille
		Targeted skills: 34(342/343), 41(413/414), 43(431/432), 56(561/562), 63(634), 110(1102) This module is an illustration of the approach and the use of mobile application development tools. The orientation is suitable for all engineering profiles in software development, cyber security, connected objects domains.
		At the end of the course, the student will:
		Know how to translate the client needs into functional specifications (application scenario)
		Be able to design a scenario adapted to the customer needs and to the constraints related to the device used
	LEARNING OUTCOMES	Be able to develop an application under android and choose the ergonomics best suited to the subject
		Know the Android development environment
		Know how to use a configuration management environment (git)
		Be able to present the application to a client
		Know how to write a technical document of implementation and recipe
		Be able to present its application and to argue the ergonomic choices
		The project approach requires the acquisition of technical and transversal skills such as the taking into account of a need, analysis and proposal of solutions, communication and restitution.
		This module covers the following topics:
		■ The Android platform and its architecture
		■ The development tools, development framework: Android Studio
		■ The specificities of mobile terminals in terms of display and interaction with the user
		■ The Android development
رگ	COURSE DESCRIPTION	The life cycle of the application (simulation, testing and debugging)
\$ =	COURSE DESCRIPTION	The overview of the layout and the position of the component
		■ The design of a graphical interface with views
		The event management (implementation, reaction, listening)
		■ The component model
		■ The persistence of data
		■ The use of the embedded database (SQLite), the insertion of data

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	3	D. Delannoy	French

÷;	PREREQUISITES	To follow this module, the student must know the notions of databases (reading a Conceptual Data Model, SQL queries) and have implemented these notions.	
		Targeted skills: 32(321/323), 34(342/343), 43(431/432), 56(561/562), 63(634), 110(1102)	
		This module addresses the notions of data modeling based on the MERISE method and allows to understand the whole chain from conception to implementation in a relational database.	
		The orientation is suitable for all engineering profiles in software development, big data, connected objects, engineer of business domains.	
	LEARNING OUTCOMES	At the end of the course, the student will:	
		Know the concept of Information System data modeling	
		■ Be able to model the data of a Small Information System	
		Know how to read a conceptual data model and transform it into tables	
		Know the process of creating a database under PostgresSQL	
		■ Know how to insert data into a database and select them according to different criteria	
		Know how to select data in a database according to different criteria	
		This module covers the following topics:	
		■ The role of modeling	
		■ The relational principle of organization of information	
~~		■ The presentation of the MERISE method	
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	COURSE DESCRIPTION	■ The conceptual, logical and physical modeling	
<u>v-</u>)		■ The implementation of relational databases	
		■ The principles of a Database Management System (DBMS)	
		■ The description language of the database (SQL)	
		■ The data manipulation language (SQL)	

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	2	J. Roland	English

÷;	PREREQUISITES	Basic UNIX usage experienceC programming
	LEARNING OUTCOMES	 Identify the different layers of the UNIX system architecture Write programs in C to interact with the UNIX system layers (processes and files system) Manipulate signals and timers Exchange information between different processes.
()	COURSE DESCRIPTION	 UNIX history General UNIX architecture The kernel The UNIX filesystem Processes Signals Interprocess communications

quantum computing

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	2	G. Chênevert JF. Robillard	English

÷.	PREREQUISITES	This opening module is intended to be widely accessible to all and has no specific prerequisites apart from a general mastery of the useful concepts of the common core of the third year (quantum mechanics, probability, digital electronics, programming).
	LEARNING OUTCOMES	Target Skills: 34 (342), 101 (1011), 144 (1441), 146 (1461), 62 (622) To allow the student to acquire a factual and critical vision of the state of the art and the material and software perspectives related to the manipulation of quantum information. Master the foundations and put into practice simple algorithms in simulation or on real architecture (IBM Q).
\$	COURSE DESCRIPTION	 Quantum information: states and measurement Physical modalities of the qubit Logic gates Universal quantum computer Quantum simulation Main algorithms: Grover, Shor, Programming and simulation

network programming

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 1	Semester 2	2	E. Dubois	English

Ö	PREREQUISITES	 C programming Basic UNIX usage through shell commands Basic Unix programming skills in C (processes, signals) Basic IP knowledge
	LEARNING OUTCOMES	Targeted skills: 33 (331), 34 (342/343), 43 (431/432/433) Write simple TCP/IP and UDP/IP client and server programs in C Face basic security issues in network program designs Use basic network services (DNS, daytime) within C programs.
⊘ ::::	COURSE DESCRIPTION	 TCP/IP networking Socket Programming Client / Server design (TCP and UDP versions) Names and addresses conversions Case studies.

cloud computing and architecture JNIA ISEN

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	3	F. Windal D. Delannoy	English

٠, ــــــــــــــــــــــــــــــــــــ		Java Courses (M1, semester 1)
Ö	PREREQUISITES	■ Network & Sys base (M1, semester 1)
		■ Data bases (CSI3, CIR3, semester 2)
		Target skills: 34(342,343), 41(412, 413,414), 42(422), 53(531,532), 54(541,542), 61(611,612,613), 62(621,622), 63(632,634)
		Cloud Computing
		The objective of this part of the course is to introduce the fundamental concepts of Google Cloud for a company. This platform includes various cloud services for computing, storage, networking, Big Data, machine learning, Internet of things, security, cloud management and application development that are directly launched on Google's servers.
	LEARNING OUTCOMES	Architecture
		The objective of this part of the course is to understand the concept behind the term "Big data", from a perspective:
		Architectural: resource organization, servers for performance optimization
		■ Technological: the software suite deployed
		Business: understanding the client's needs for the implementation of decision support tools
		Cloud Computing
		 Introduction of the fundamental concepts of cloud computing, technical aspects (data center architecture, non-relational databases) and economic aspects (service and billing)
		 Development & deployment of a web application on the Goolge Cloud platform - PaaS service
€ S		Big data Architecture
<u>*=</u>	COURSE DESCRIPTION	Part 1: Deploying a Big Data Architecture
		Understand the notions of performance in the deployment of a Big Data architecture
		■ Acquire knowledge about data storage solutions
		■ Discern the differences between databases (NoSQL, Elastic, Oracle, MongoDB)
		Understand the importance of file systems (HDFS) in a Big Data architecture
		Example of the implementation of the "Crédit Agricole" datalake

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	3	D. Delannoy	English

	1	
Ğ	PREREQUISITES	To follow this module, the student must know the concepts of object-oriented programming and master Java programming (class, inheritance, composition, exceptions, inputs / outputs, threads,).
		Reference: "Java 1", "Java 2" M1 Junia ISEN
		Targeted skills : 31(311/312/313), 34(342/343), 43(431/432/433), 63(634), 110(1102)
		This module is a deepening of Java programming to create dynamic web applications.
	LEARNING OUTCOMES	The orientation is suitable for engineering profiles in the software development domain.
		At the end of the course, the student will:
		Know how to use a development and versioning environment
		Know how to describe a problem in the form of tests
		Understand third-party architectures,
		■ Be able to implement Web Services,
		■ Be able to develop a JEE application.
		This module covers the following topics:
		The use of version and build management tools (Maven)
\$ \$!:	COURSE DESCRIPTION	Third party architectures / JEE
<u>*</u> =	COURSE DESCRIPTION	
		Development environments The following IEE APIc: Society / ISB IBA / ITA IAV BS CDI
		The following JEE APIs: Servlets / JSP, JPA / JTA, JAX-RS, CDI

it risk and management

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 2	3	D. Delannoy	English

÷;	PREREQUISITES	None
		Targeted skills: 31(311/312/313), 32(321/322/323), 33(331/332/333), 56(561/562), 71(711), 110(1102)
		Risk management, which is taken into account in the development of the strategy and in all activities, is designed to identify events that may affect the functioning and therefore the viability of a company. It is designed to ensure the integrity of the information system and provide assurance that the cost must remain reasonable in relation to the issues.
		In connection with the business process management and IT risk management, this module provides guidance for mapping an Information System and defining action plans to enable it to render the expected services.
	LEARNING OUTCOMES	The orientation is suitable for the engineering profiles of the areas of software development, big data, cyber security and connected objects, part of project management allows to integrate managerial profiles.
		At the end of the course, the student will:
		Understand the challenges of an information system
		■ Be able to identify the processes implemented
		Know how to follow a method of risk analysis
		■ Be able to identify, analyze and classify risks
		Know how to design a business recovery plan
		The case-of-use approach requires the acquisition of transversal skills such as taking into account a need, analyzing and proposing solutions, project management, group work, communication and restitution.
\$ ==	COURSE DESCRIPTION	Based on the "experience", "concrete cases" of business problems are developed in favor of a controlled management of business processes. These cases will illustrate the necessary steps in the MOA (project owner or contractor for whom the work is being carried out) and the MOE (project management or technical integration).

object oriented design

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	3	D. Delannoy	English

Ö	PREREQUISITES	To follow this module, the student must know the concepts of objects (construction of simple objects, construction of composite objects, inheritance, polymorphism, exceptions,) and have implemented these notions in JAVA or C ++.
		Reference: "Java 1" M1 Junia ISEN
	LEARNING OUTCOMES	Targeted skills: 31(311/312/313), 43(431/432/433), 63(634)
		Training in the development of computer applications addressed by the use of an object-oriented programming language such as JAVA or C ++ would not be complete if it was not accompanied by a preliminary approach of structured design and compliance with standards.
Δ ()		The design of an application in an object language consists of identifying reusable logical entities and organizing them in a flexible way, avoiding, as far as possible, the interdependencies. The main benefits that can be derived from this are mainly a better adaptability of the application in case of evolutions of needs, a greater efficiency in the organization of developments, and a greater maintainability of their source code. However, when implemented without respect for specific rules, this approach can also introduce a level of critical complexity that is a danger to the evolution of projects.
		This course aims at professionalizing the object-oriented design of a software, notably by studying certain design archetypes, called "Design Patterns", and by introducing a formal representation language Of the structure of a program ("Unified Modeling Language").
		At the end of the course, the student will:
		Know how to design the architecture of a complex program using an object-oriented language
		■ Be able to choose the right design patterns to use depending on the problem
		Know a part of the UML language to model an application
		■ Know the main types of design patterns.
	COURSE DESCRIPTION	UML (Unified Modeling Language) is the language used to model and represent the architecture of a software. The parts "diagram of classes" and "diagrams of interactions", of interest to us in this course, allows to specify the different classes of the applications as well as their interactions in the form of diagrams. UML is a standard adopted by leading market players for object-oriented application design and project documentation.
c S		Design patterns describe class and object organizations to facilitate code reuse and maintenance.
<u>*</u> =		A design pattern can be seen as a form of organization to solve a generic design problem. It is therefore reusable and can be transposed to several applications. Thus, a design pattern describes an optimal solution to a problem often encountered in application development.
		This module covers the following topics:
		■ The UML: class diagrams and sequence diagrams
		■ The design patterns of GoF (Gand of Four)
		■ The MVC pattern (Model Views Controllers) and its variants

urbanization of it services

Level	Period	ECTS Credits	Teacher Coordinator	Language
MASTER 2	Semester 1	2	D. Delannoy	English

	PREREQUISITES	None
		Targeted skills: 31(311/312/313), 32(321/322/323), 33(331/332/333), 56(561/562), 71(711), 110(1102) In connection with technical and management, this module allows to understand the stakes and to master the deployment of the new information technologies. The agility that determines responsiveness to evolutions applies not only to software development, but also to the way in which the businesses and functions of the company rely on a harmonious set of resources - hardware, software, personnel, data and Procedures.
		The construction of an information system can no longer be freed from urbanization without compromising its ability to integrate new needs as a city could fade due to the lack of adequate infrastructures.
	LEARNING OUTCOMES	The aim is to provide a complementary managerial dimension to the technical training required for architectural missions.
		The orientation is suitable for the engineering profiles of the areas of software development, big data, cyber security and connected objects, part of project management allows to integrate managerial profiles.
		At the end of the course, the student will:
		Understand the challenges of an information system
		■ Be able to identify the architecture of an information system (from hardware to applications
		Know how to follow a method of analysis of the computer heritage
		■ Be able to identify, analyze and classify the axes of improvement of an information system
		Know how to design an evolution plan
		Know how to follow urbanization methods and good practices
	COURSE DESCRIPTION	Such as urbanization of human habitat (organization of cities, territory), its concepts have been taken up in computer science to model and formalize the engineering of Information Systems (IS). Urban planning thus defines rules and a coherent, stable and modular framework, to which the various stakeholders refer for any investment and evolution decision relating to the Information System. An introduction to the use of "best practices" ITIL (Information Technology Infrastructure Library) presents the methods and tools that today are indispensable for improving the management of IT services. It brings together the means to structure and improve the efficiency, performance and costs of these services. The adoption of these good practices ensures that customers and suppliers (internal and external) have a service that meets internationally established quality criteria.
<u>* =</u>	COURSE DESCRIPTION	This module covers the following topics:
		■ The role and the stakes of an information system
		The foundations and principles of urbanization
		■ The strategic changes in the company
		■ The market opportunities
		■ The role of the players in the information system
		The mapping tools and metamodel representation
		The definition of the different missions of urbanization
